Post translational modification of proteins in the context of immune recognition

F. Hudecz [1,2]

[1] Research Group of Peptide Chemistry, Hungarian Academy of Sciences, Eötvös Loránd University (ELTE),
[2] Department of Organic Chemistry, Institute of Chemistry, ELTE, Budapest, Hungary

In vivo post-translational modifications - diversity

alkyl
acyl (O-,N-,S-)
- N-terminal,
- Lys,
- Ser, Thr

amide
- C-terminal

phosphoric acid ester (Ser, Thr, Tyr)
sulphonic acid ester
glycosylation
- O- in Golgi (Ser, Thr)
- N- in RER (Asn)

nitrosation
desamidation
decarboxylation
Arg desamination,
- citrullination (Arg -> citrullin)

hydroxylation (Pro, Lys)
oxidation
gamma-carboxylation (e.g. Glu)
beta-elimination (e.g. Thr -> alkene)

Cleavage of peptide bond
- N-terminals Met or fMet
- signalpeptide
- precursor activation (proinsulin → insulin)

Disulphid bond formation

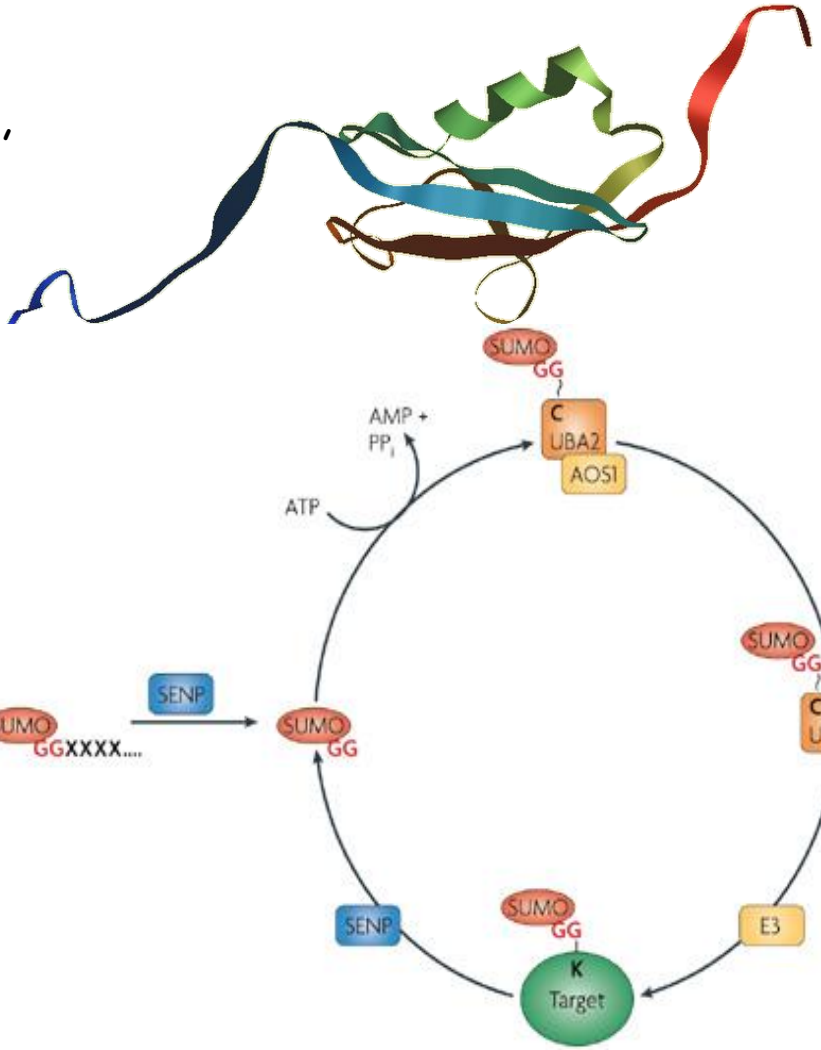
Isomerisation (Pro, Asp)

Coupling of nucleotide (e.g. flavine)

Coupling of protein/peptide :
- sumoylation (SUMO protein)
- ubiquitination (ubiquitin)
- neddylation (Nedd)

SUMOylation
(Small Ubiquitin-like Modifier)

Involved in nuclear-cytosolic transport,
transcriptional regulation,
apoptosis
protein stability,
but, not in degradation



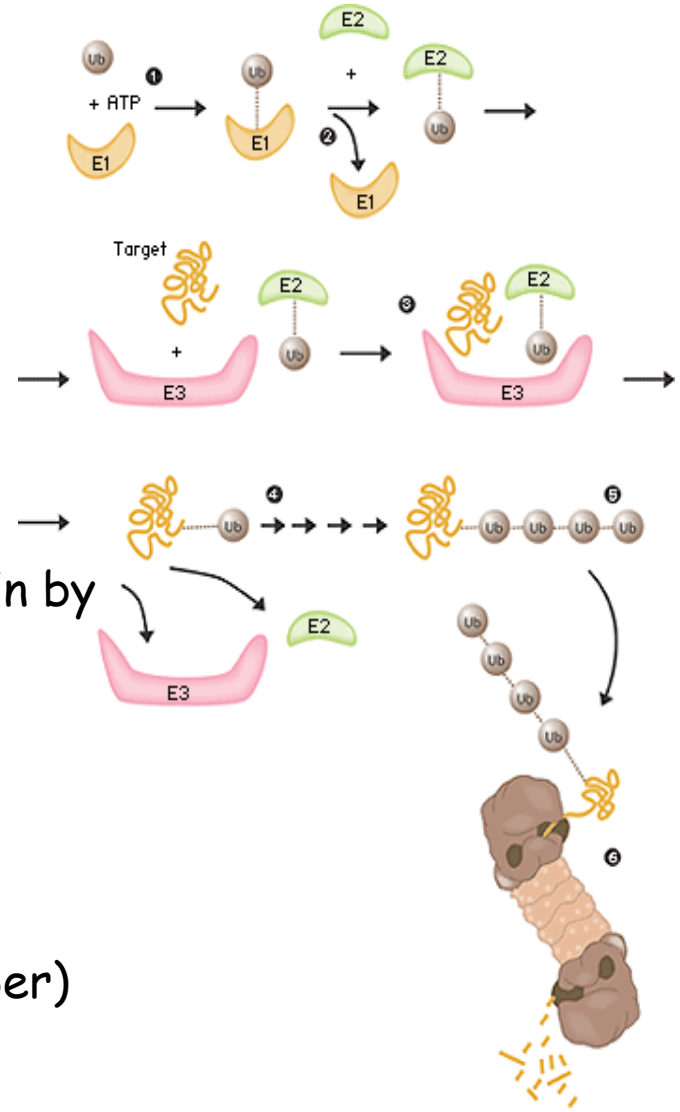
- SUMO proteins: 100 aa. , 12 kDa, 4 isofor
- Post-translational modification
- Activation: - cleavage of 4 residues at th
  C-terminal
- Attachment to target protein by using three enzymes .

R. Geiss-Friedlander & F. Melchior
Nature Rev. Mol. Cell Biol. 8, 947-956 (2007)

Ubiquitination

KUNGL. VETENSKAPSAKADEMIEN
THE ROYAL SWEDISH ACADEMY OF SCIENCES

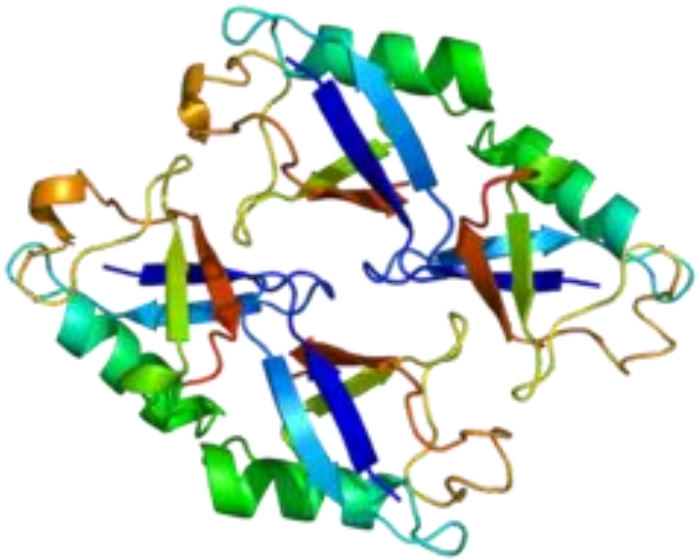
Nobel Prize in Chemistry, 6 October 2004
A. Ciechanover, A. Hershko, I. Rose

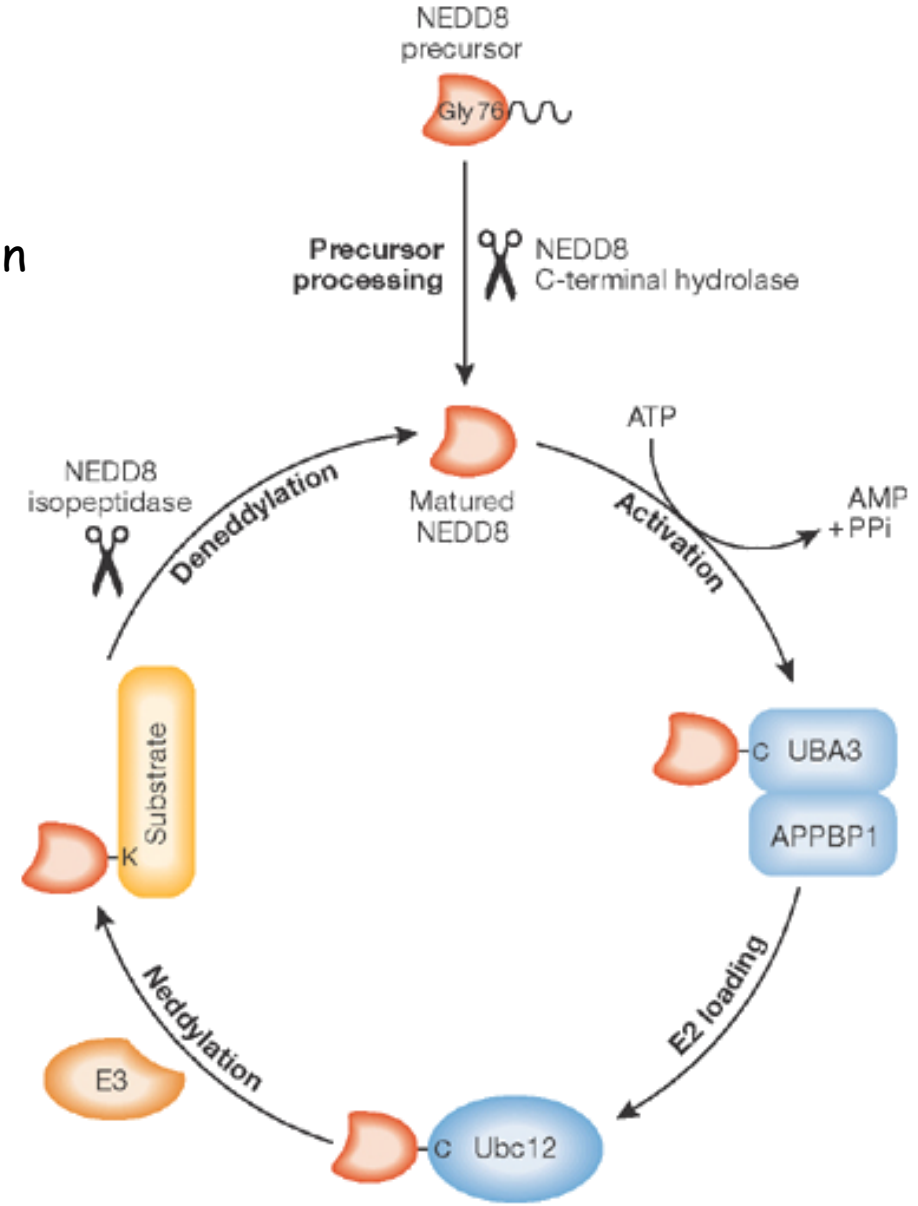


- Ubiquitin: protein (76 aa., 8.5 kDa)
- Almost all tissues of eukaryotic organisms
- „Label"the degradation of the attached protein by transporting to proteasome.
- Isopeptide linkage (4)
- Enzymes involved:
  - E1 (ub activation)
  - E2 (ub conjugation to ε-amino group (Lys), thiol (Cys) by thioester, and to OH (Thr/Ser) by ester foramation
  - E3 (ub ligation)

NEDDylation
(Neural-precursor-cell-expressed developmentally down-regulated)

- Function:
  activation/regulation of ubiquitin





Post-translational modification: Immune recognition related diseases

Modification	Autoantigen	Disease
Acetylation	Myelin basic protein	Multiple sclerosis
Citrullination	Collagen type II Myelin basic protein	RA Multiple sclerosis
Deamidation	Insulin	Type I diabetes
Glycosylation	Insulin proceptor Collagen type II Thyrotropin receptor Myelin oligodendrocyte glycoprotein Mucin glycoprotein (MUC2)	Diabetes RA Graves disease MS Colon carcinoma
Isoaspartylation	snRNP	Systemic lupus erythematosus
Lipoylation	PDC-E2	Primary biliary cirrhosus
Phosphorylation	Myelin basic protein	Multiple sclerosis
Methylation	Sm, D1,D3	Systemic lupus erythematosus
Transglutamination	Histone H2	Systemic lupus erythematosus
Tyrosine nitration	Mitochondrial proteins	Experimental autoimmune uveitis

Aims

1. Identification of minimal and optimal antibody epitope of partially deimidated filaggrin by synthetic peptides based on 306-324 sequence using multi-pin approach and serum samples from diseased individuals.

2. Introduction of biotin label for soluble epitope peptide

3. Analyze
   - the effect epitope size and orientation on antibody recognition,
   - the effect the presence and position of biotin on solution conformation,
   - RA specificity in serum samples as compared with that of SLE and healthy individuals using the optimized peptide epitope by direct ELISA.

   - the effect epitope size and orientation on antibody recognition,
   - the effect the presence and position of biotin on solution conformation,
   - RA specificity in serum samples as compared with that of SLE and healthy individuals using the optimized peptide epitope by direct ELISA.

Analysis of antibody binding to biot-β60-74Cit/Arg peptide by direct ELISA

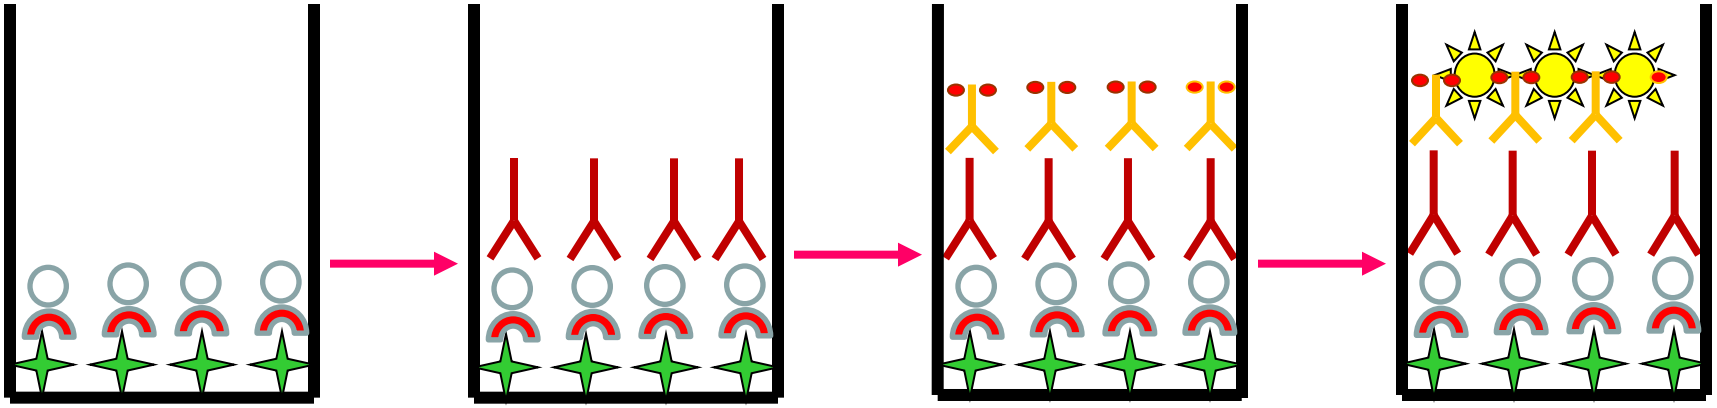

Plate coated by avidin: biotin-peptide

Serum antibodies

Enzyme conjugated second antibody

TMB substrate : positive reaction

Avidin

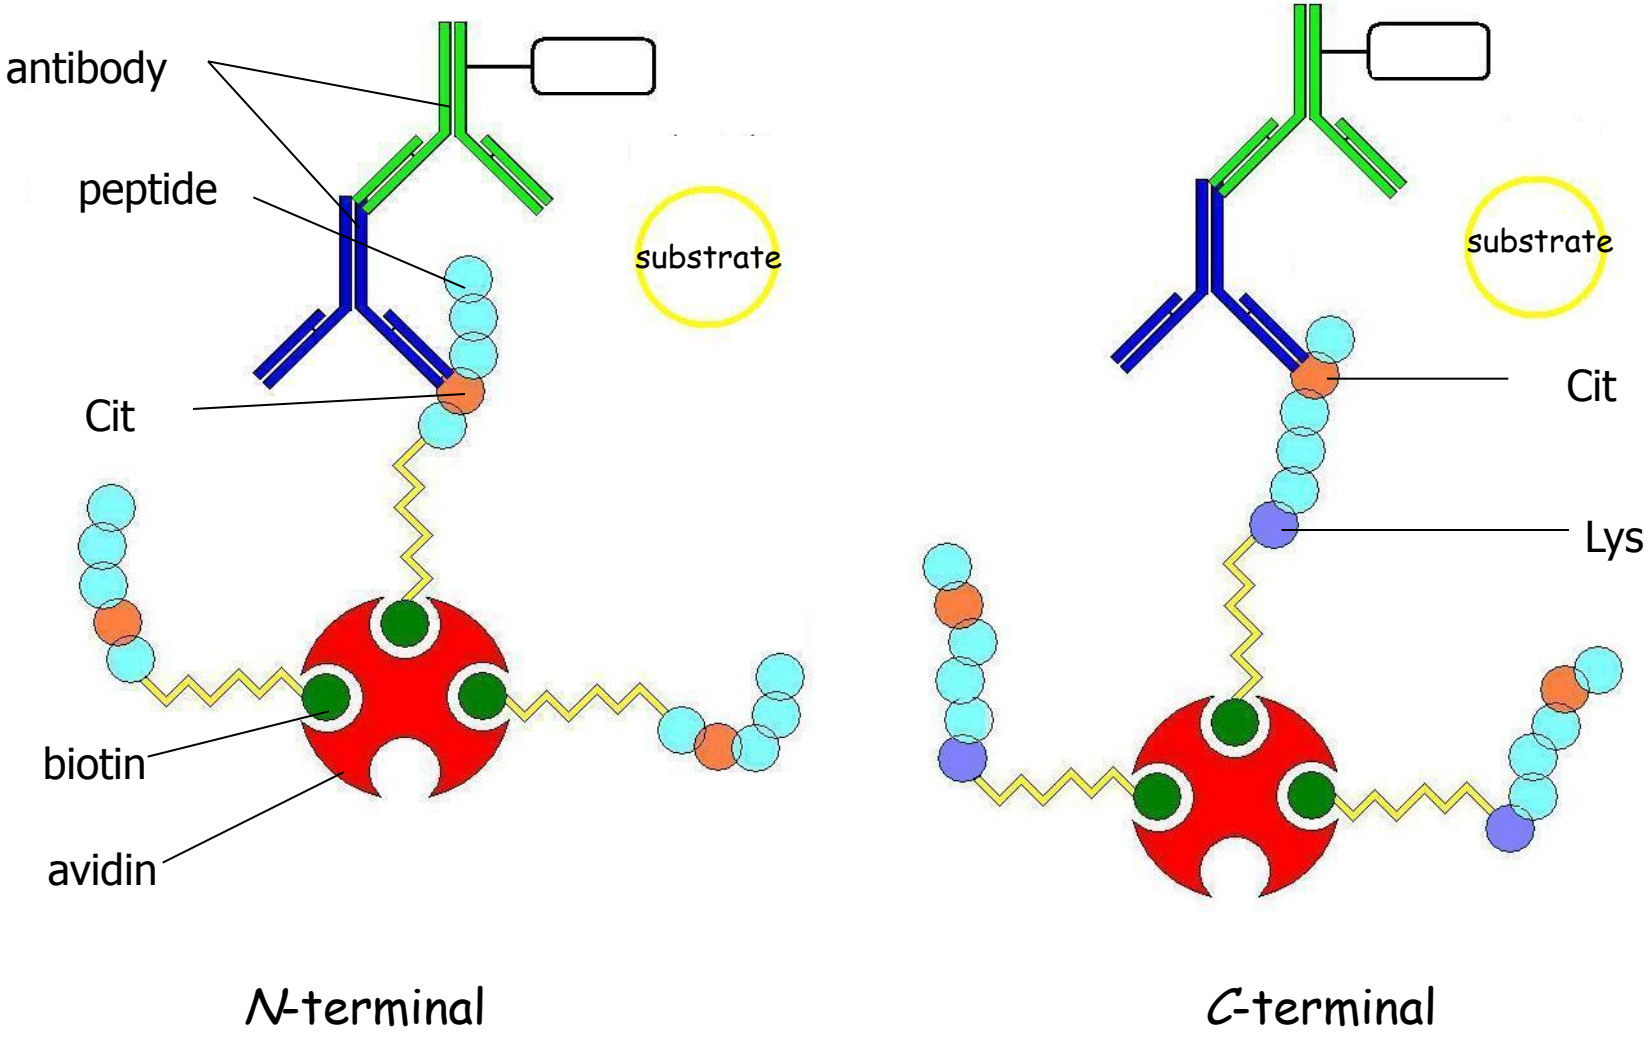
Serum antibodies (healthy/RA)

Tetramethylene benzidine (TMB)

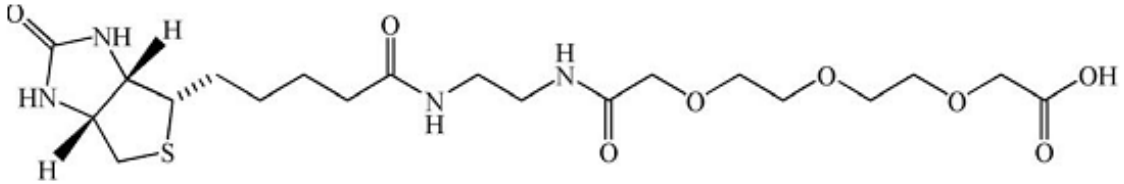
Biot-β60-74Cit/Arg peptide

HRP enzyme conjugated anti human IgG antibodies

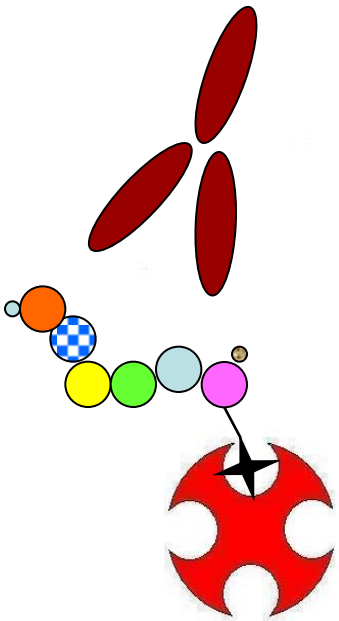
The effect of epitope orientation:the position of biotin

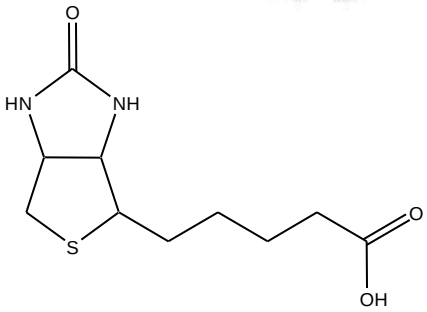


The effect of epitope accessibility: linkers

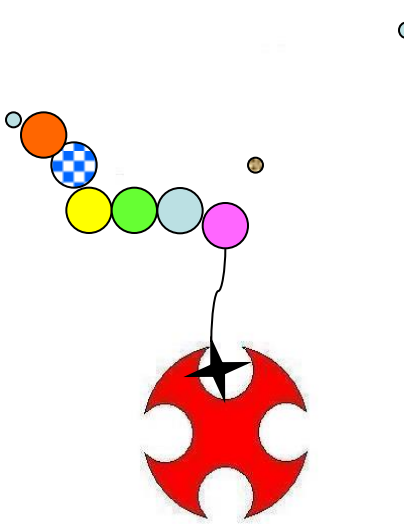


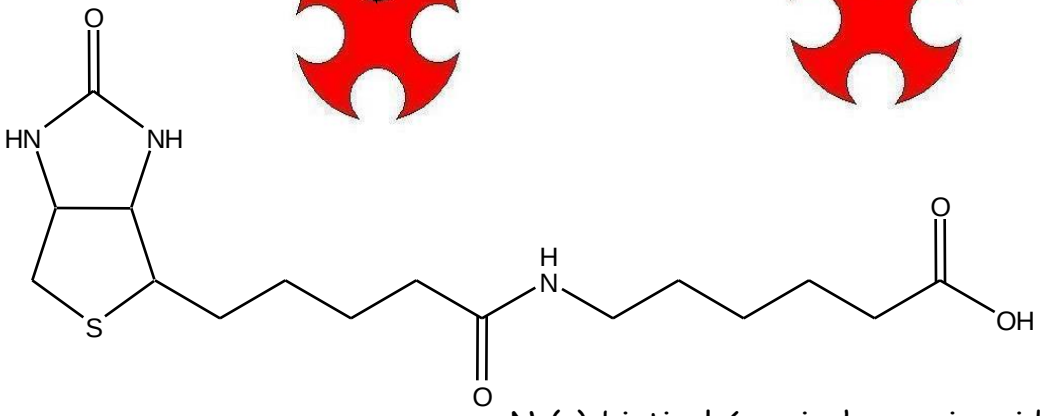
Biotinyl-4,7,10-trioxa-1,13-tridecandiamino-succinic acid





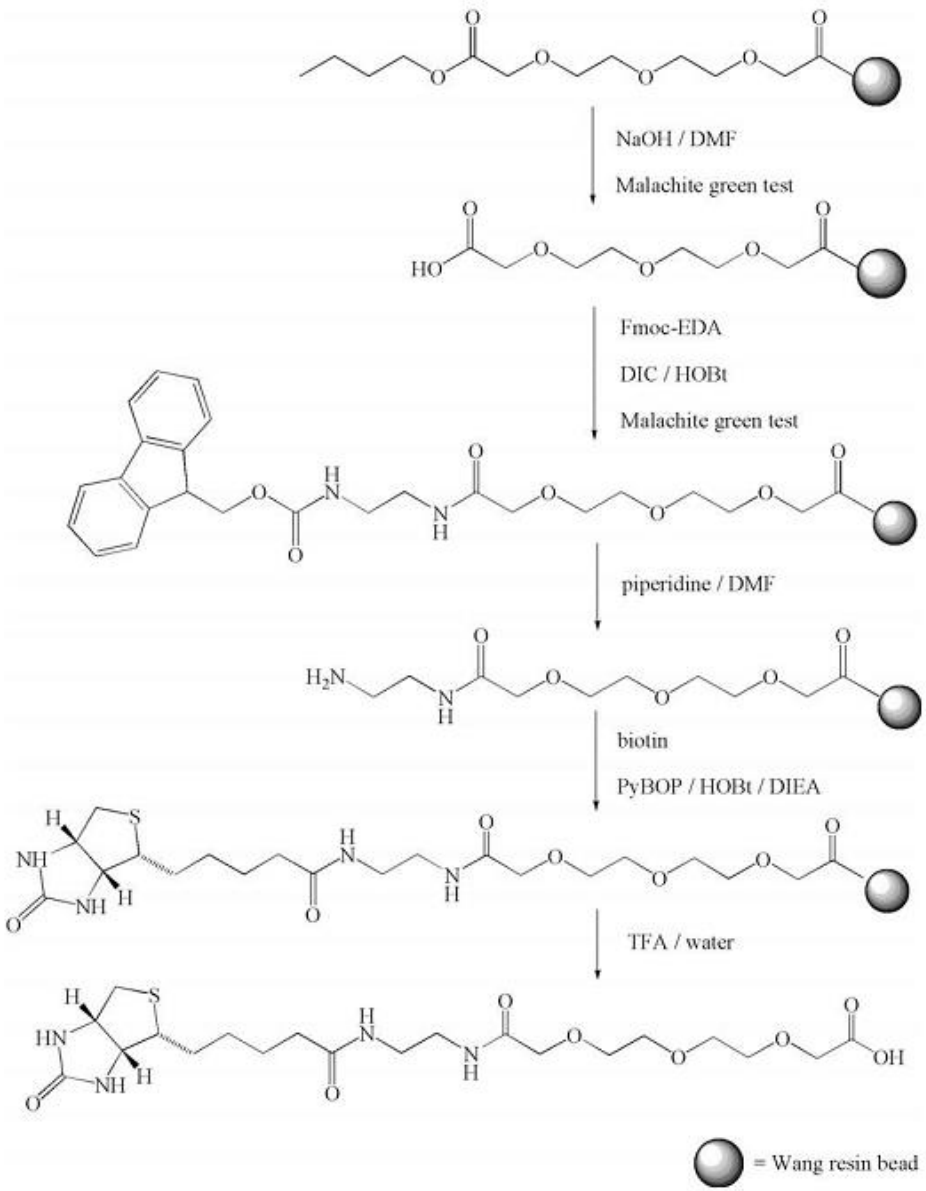
(+)-biotin





N-(+)-biotinyl-6-aminohexanoic acid

Synthesis of biotinyl-4,7,10-trioxa-1,13-tridecandiamino-succinic acid



Bartos, Á. et al.
Biopolymers 92: 110-115 (2009)
Bartos, Á. et al.
Tetrahedron Letters 50: 2661-2663 (2009)

Aims

1. Identification of minimal and optimal antibody epitope of partially deimidated filaggrin by synthetic peptides based on 306-324 sequence using multi-pin approach and serum samples from diseased individuals.

2. Introduction of biotin label for soluble epitope peptide

3. Analyze
   - the effect epitope size and orientation on antibody recognition,
   - the effect the presence and position of biotin on solution conformation,
   - RA specificity in serum samples as compared with that of SLE and healthy individuals using the optimized peptide epitope by direct ELISA.

Analysis of serum samples

Samples:
263 RA patients with established disease,
46 CCP negative, non-RA patients with other autoimmune diseases
18 patients with systemic lupus erythematosus
152 age-matched healthy controls

The diagnosis of the disease was established on the basis of the revised ACR/EULAR classification criteria. [1]

The baseline data of RA patients:
32 men/176 women; age: 58,4 +/– 14,3 years;
rheumatoid factor (RF) +/–: 127/30; CCP2 +/–: 157/27; MCV +/–: 164/25;
disease duration: 9.8 +/– 9,4 years.

Statistical analysis: ANOVA, compared with Pearson's correlation analysis

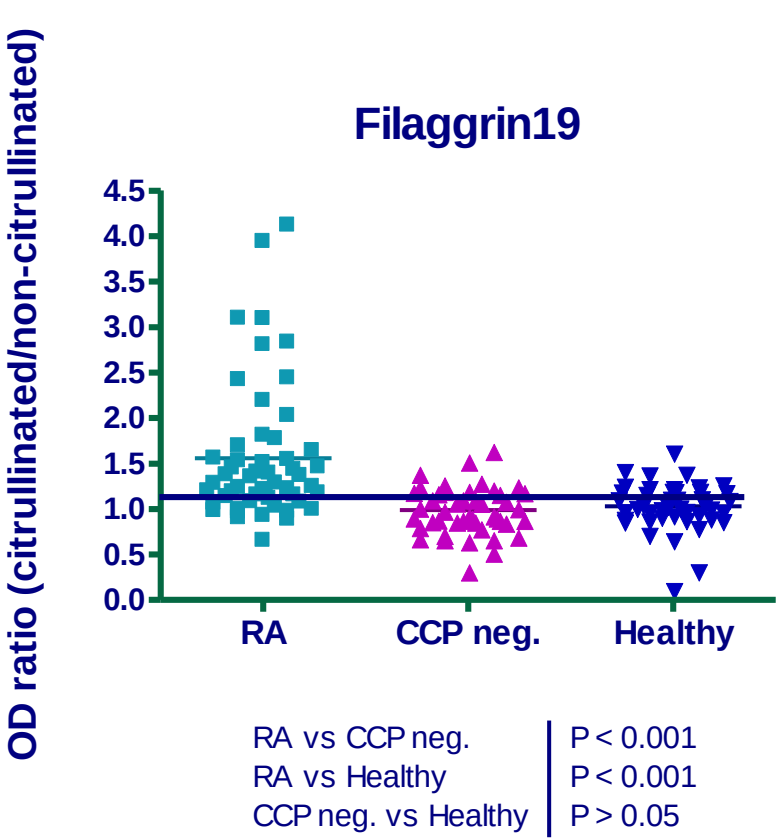
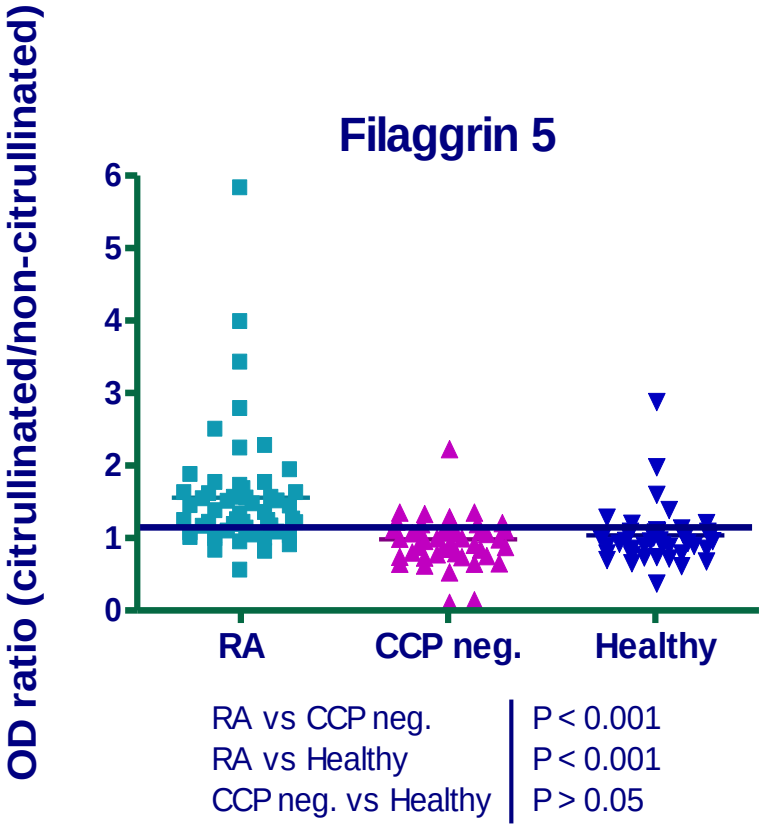
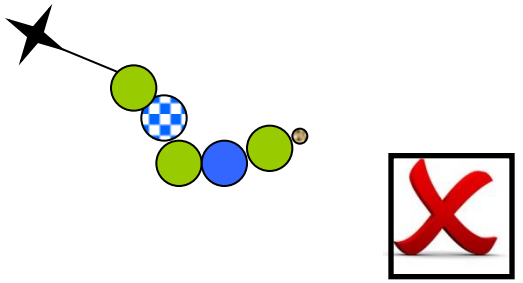
Both C- and N-terminal biotinylated 19-mer epitope peptides are recognized by RA sera samples

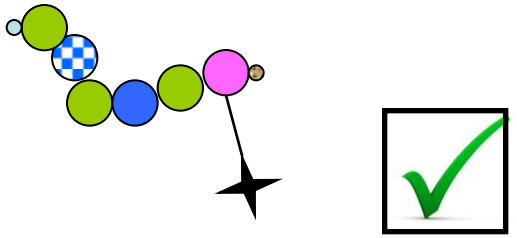
Comparison of antibody recognition of the 5-mer and the 19-mer epitope peptide

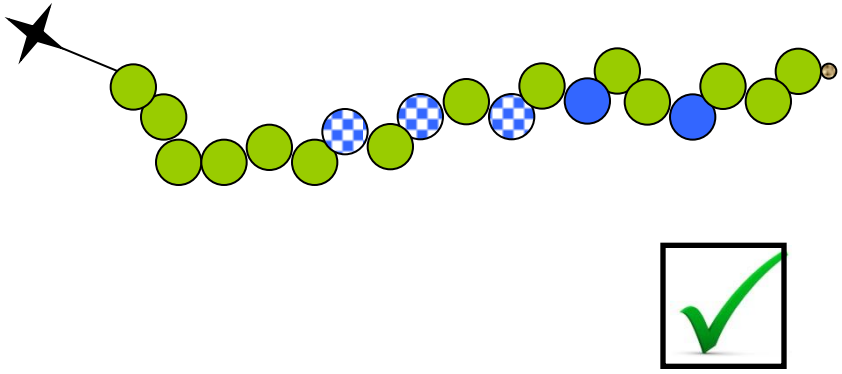


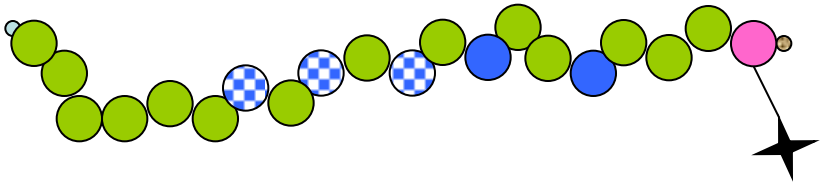


Short summary

N-terminal biotinylation	C-terminal biotinylation
		








ECD (Electronic Circular Dichroism)

Instrument: Jasco-810

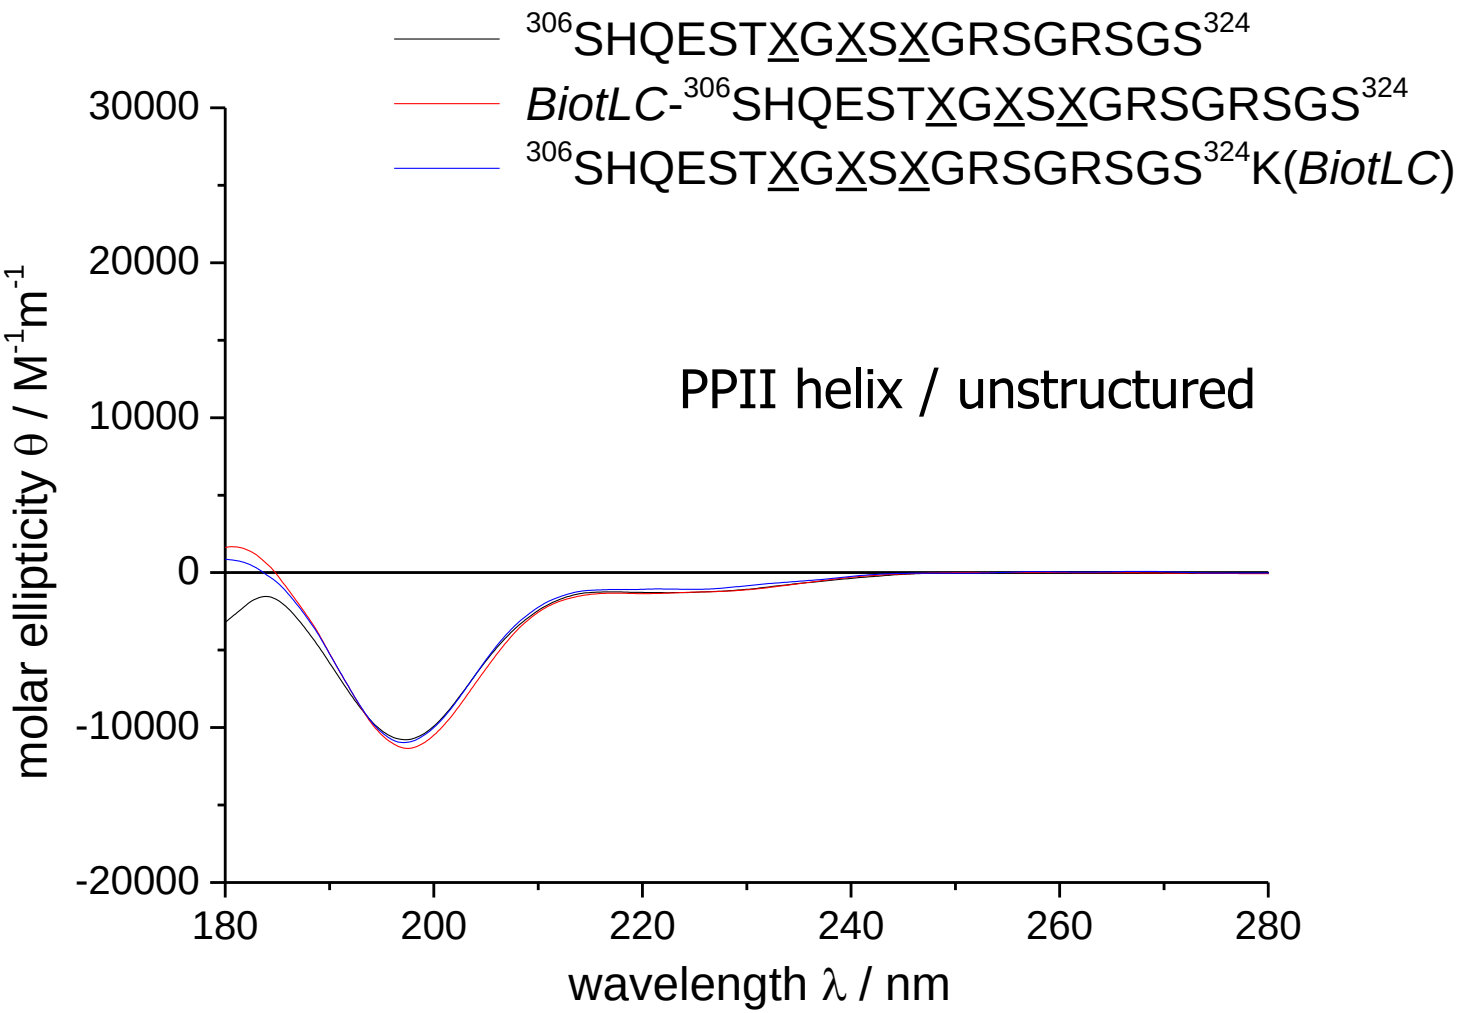
http://www.andrew.cmu.edu/user/jamess3/JWSfac.html

Solvent:

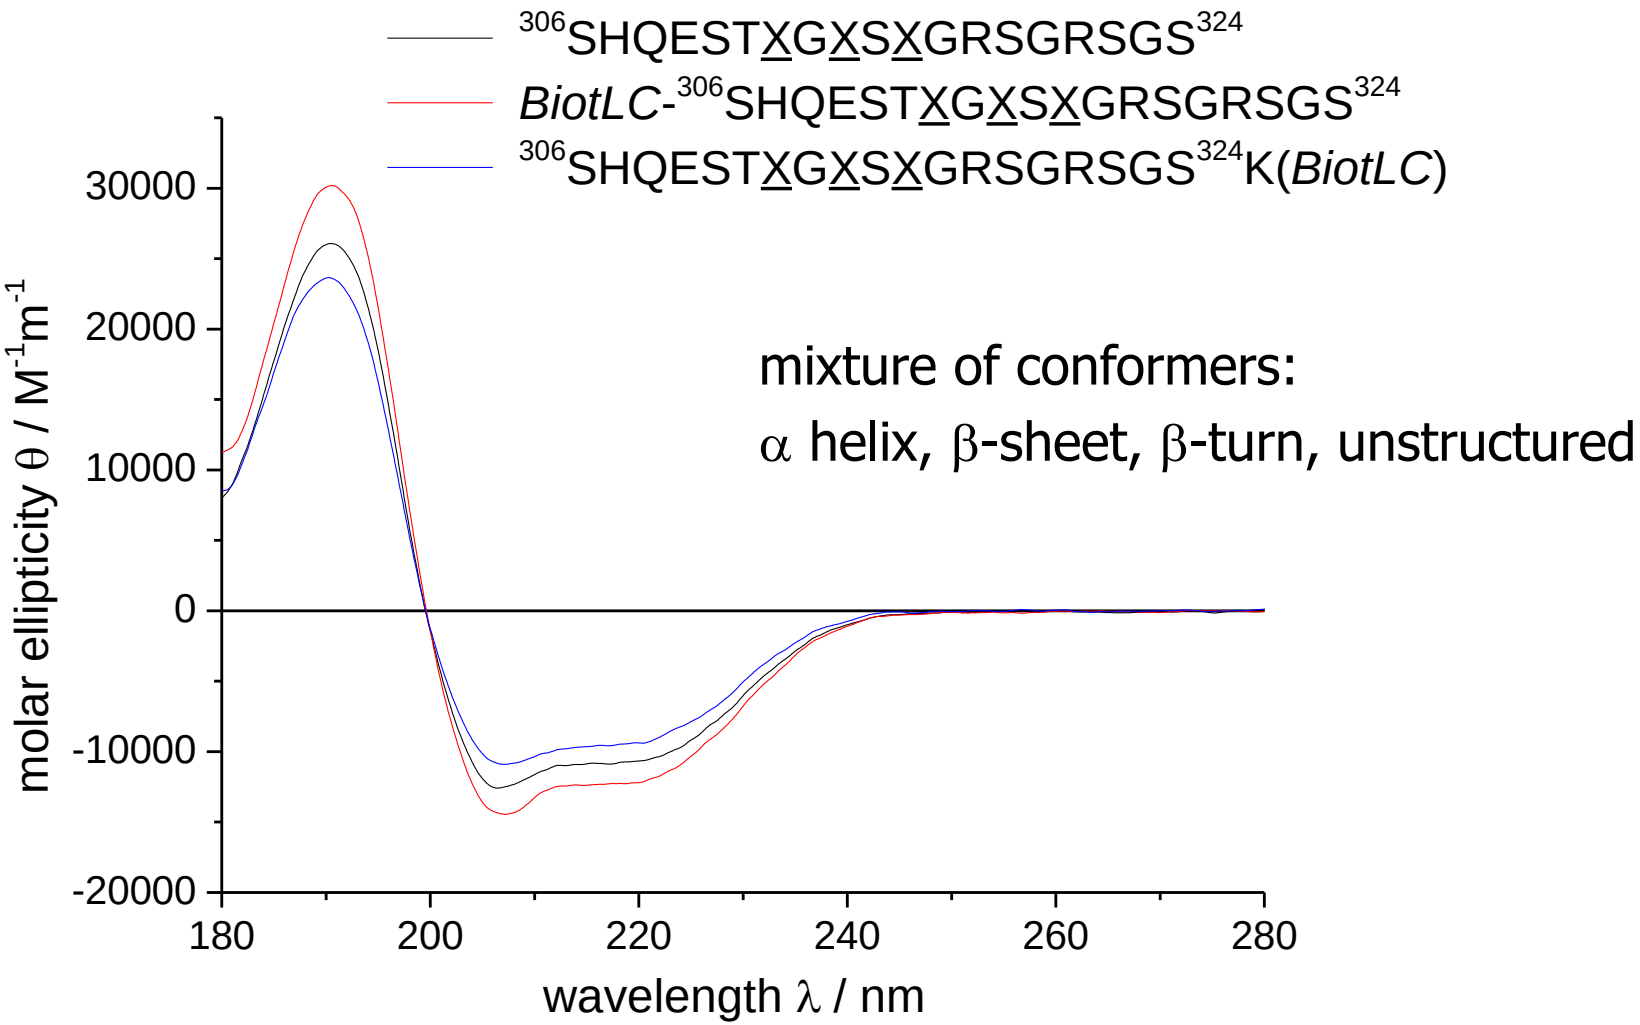
- water
- TFE

Concentration: 0,5 mg/ml
Wavelength: λ=180-300 nm
0,02 cm quartz cuvette

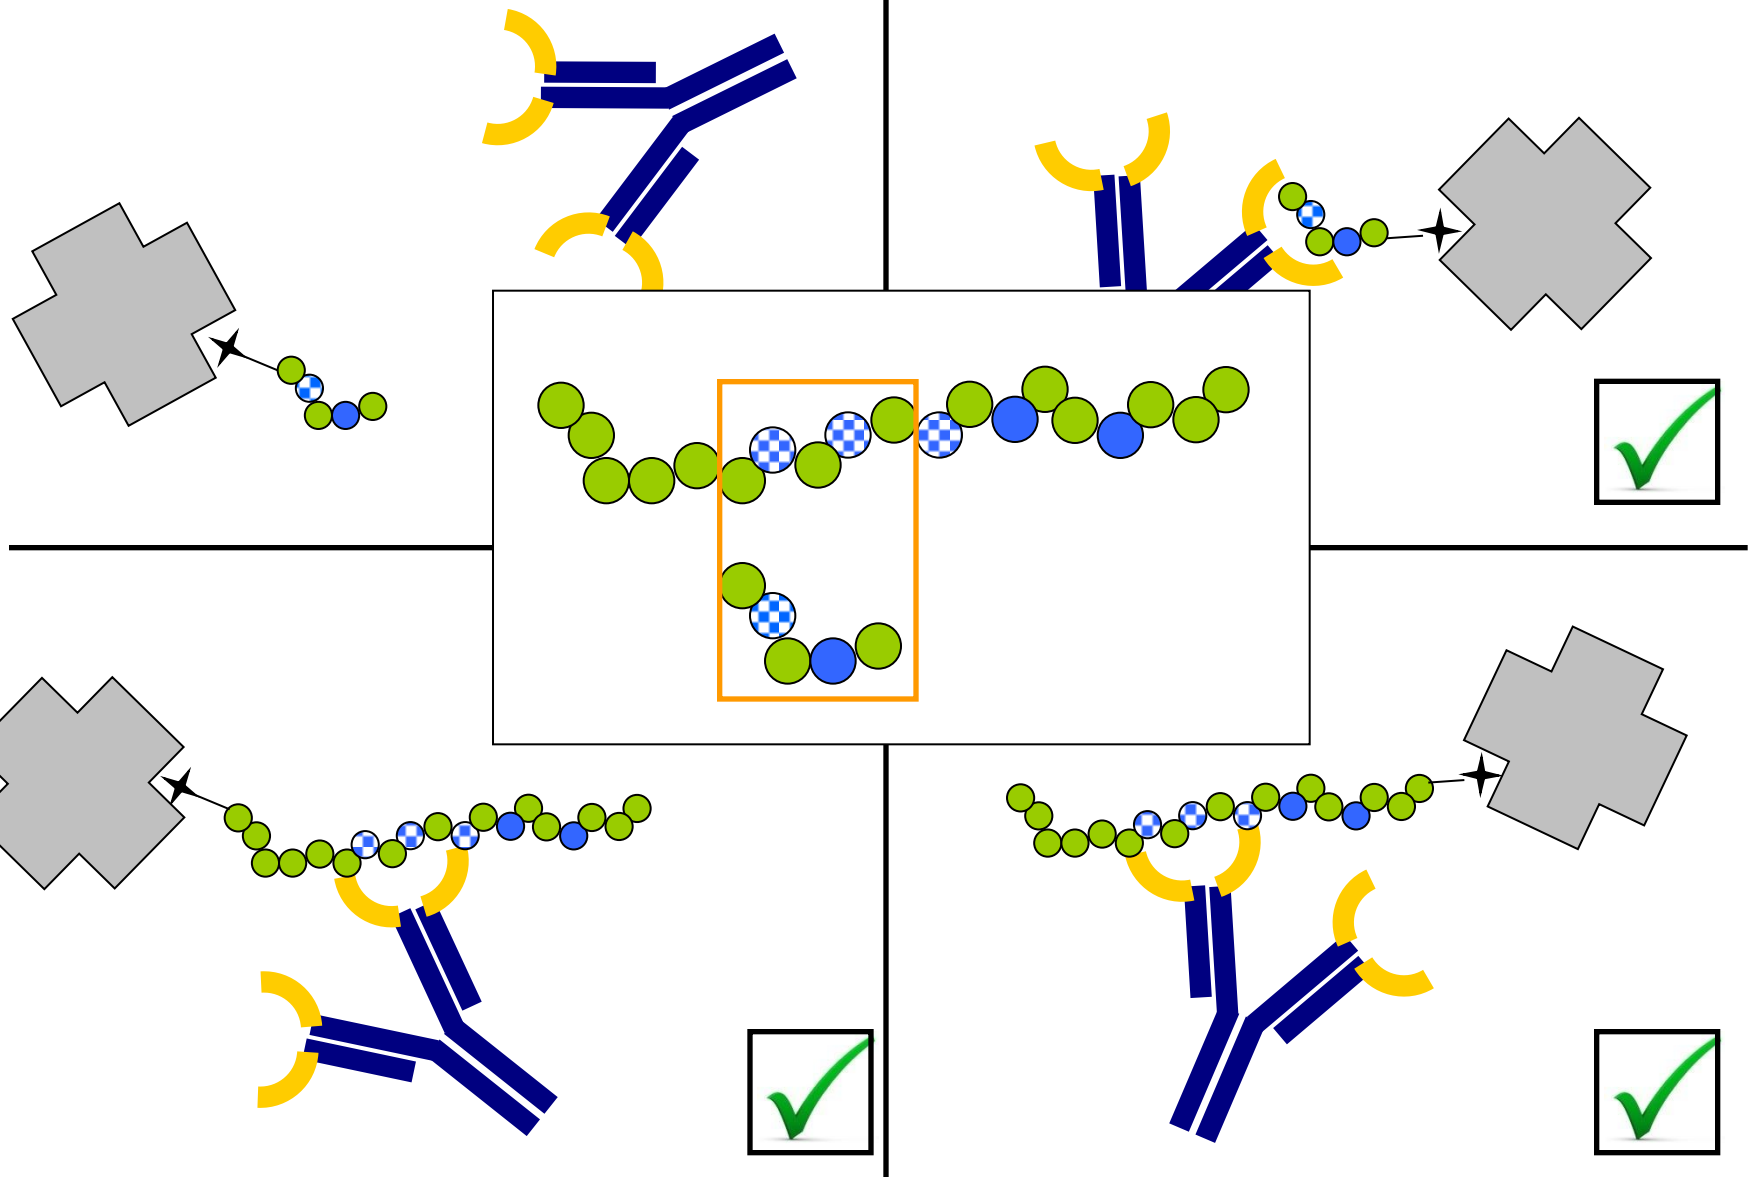
The effect of biotin position on ECD spectra of 19-mer in water



The effect of biotin position on ECD spectra of 19-mer in TFE



The position of the epitope core within the epitope region influence the antibody recognition



Conclusions

1. An epitope region (19-mer) and an epitope core (5-mer) were identified.

2. Introduction of biotin to the *N*-terminal of the 5-mer resulted in no binding. The presence of biotin at the *C*-teminal of the 5-mer had no effect on binding.

3. However, the presence of biotin at *N*- or *C*-terminal of the 19-mer has no effect on epitope recognition by serum antibodies.

4. The position of biotin markedly influences the solution conformation of the epitope peptide (5-mer). In contrast, no influence of the biotin position could be detected in case of 19-mer epitope region peptide.

5. The 5-mer as well as the 19-mer citrullinated peptides have shown a significantly higher reactivity with CCP^+ RA sera as compared to healthy controls, CCP^- serum samples.
