Structure determination – „single particle”

Cryo-electron microscopy

CRYO-ELECTRON MICROSCOPY

A beam of electron is fired at a frozen protein solution. The emerging scattered electrons pass through a lens to create a magnified image on the detector, from which their structure can be worked out.

Summary I

- **Metrics for comparing structures**
- **Information on function of mechanism**
- **Some membrane protein structures might be biased by the lipid environment**

Effect of mutations

- **Folding**
- **Trafficking**
- **Function**
- **Combinations of these**

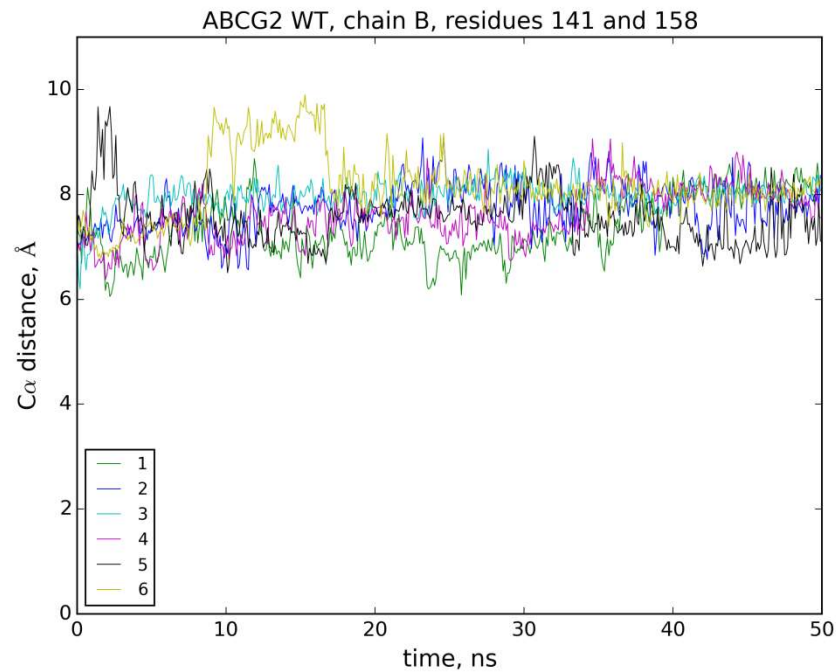

The Q141K variant of ABCG2

MD simulations

- **Insertion of ABCG2 into a membrane (POPC) bilayer**
- **Optimizing the packing of a.a. side chains, lipids, and water molecules:**
 - energy minimization
 - equilibration (6 parallel with random velocities)
 - minimal backbone movements (position constrains)
- **Production run**
 - no constraints
 - 50 ns x 6 = 300 ns;
- **Comparing the WT and the variants**
(e.g. Q141K, R482G)

Effects of Q141K on the 141/158 interaction

Effect of Q141K on the 141/382 (NBD/TMD) interaction

Maturation of the CFTR protein

In silico study of NBD1 destabilization

1. Molecular dynamics (MD) simulations

- WT and mutants
- 100-100 ns
- *all-atom force field*

2. Analysis of motions in NBD1

- correlations in motions (pairwise)
- building a graph
- analysis of the graph

Correlation in motions

Nodes: amino acids

Edges:

- displacement Vector Correlation Coefficient
- Contacts in 75% over the simulation time

Community analysis (e.g. critical nodes)

$$VCC = \frac{\langle (A - \langle A \rangle)(B - \langle B \rangle) \rangle}{\sqrt{\langle (A - \langle A \rangle)^2 \rangle \langle (B - \langle B \rangle)^2 \rangle}}$$

WT

ΔF508

Distance Correlation Coefficient

G. J. Szekely *et al.* (2007), *Annals of Statistics*, 35 (6): 2769–2794.

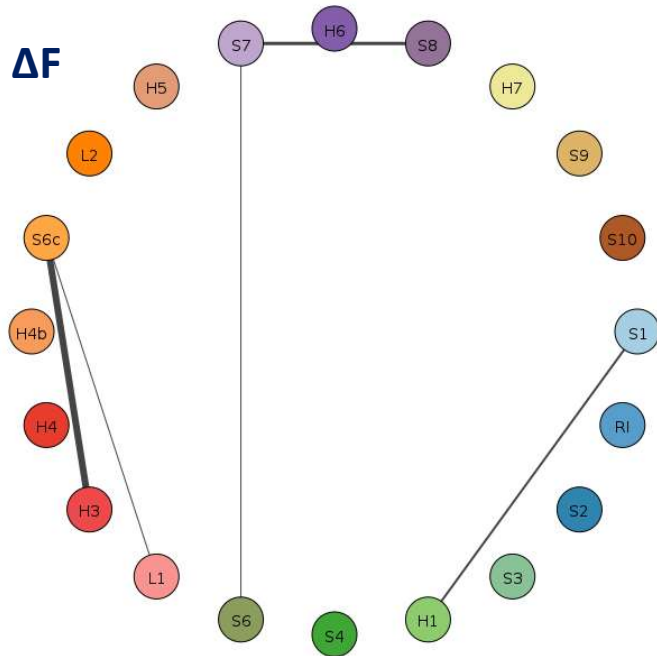

$$\text{DiCC} = \frac{\nu(\mathbf{A}, \mathbf{B})}{\sqrt{\nu(\mathbf{A}, \mathbf{A})\nu(\mathbf{B}, \mathbf{B})}}$$

Nodes:

secondary structure elements

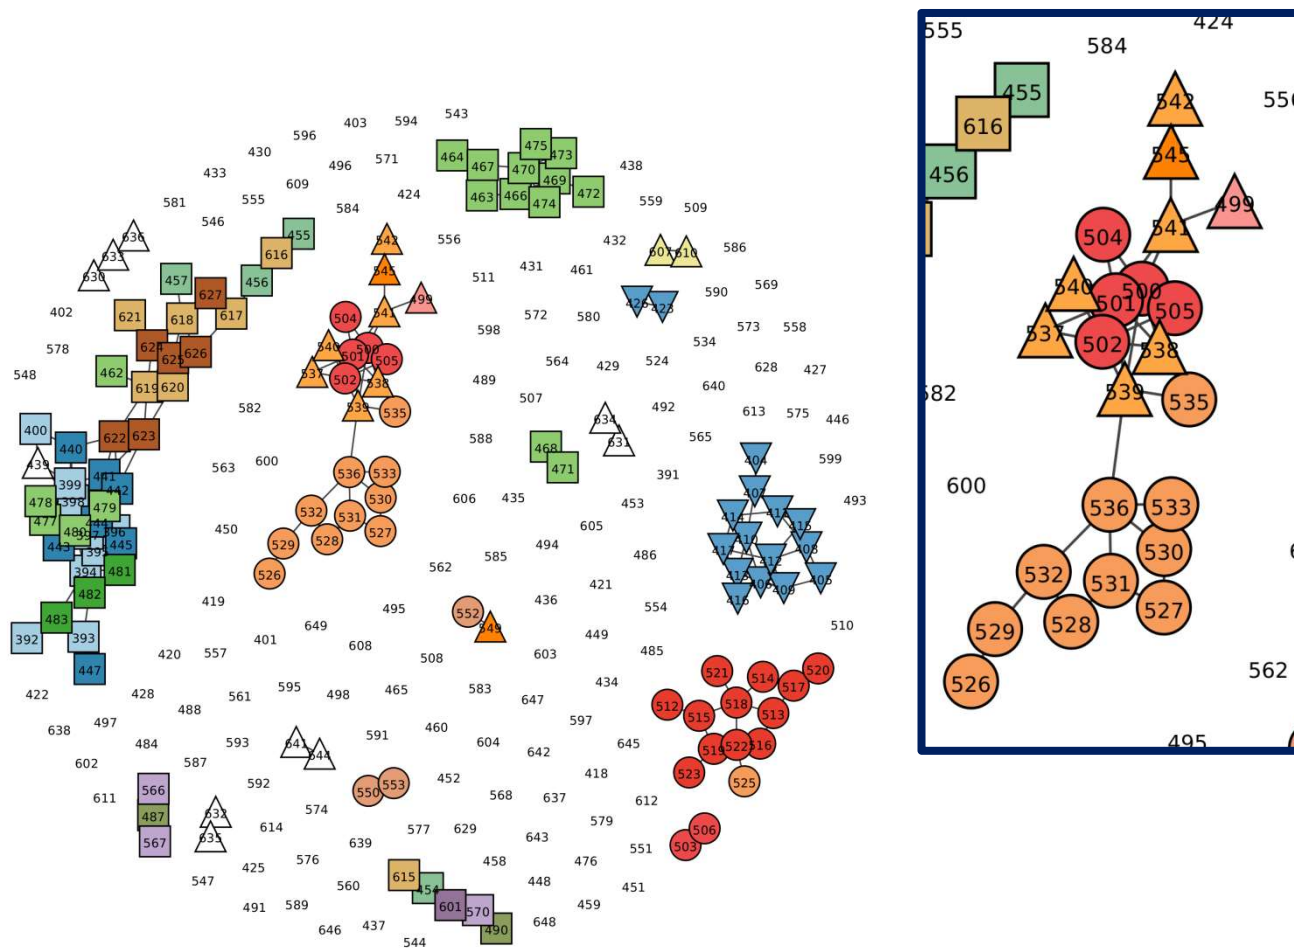

Edges:

if DiCC > 0.85

Identification of critical amino acids

WT

Summary II

- **Even relatively short MD simulations can reveal effects of mutations on structure and dynamics**
- **Understanding the changes contribute to better treatments**

Function

- Large conformational transitions on the ms timescale
- Small but characteristic motions from MD simulations
- Special simulation techniques

Identification of drug binding sites using *in silico* docking

verapamil

flavopiridol

Exploring drug binding sites by biased MD simulations

zfCFTR

CFTR_{MCJD}

Where is the channel? Caver

Summary III

- Tricks are needed to model events happening on longer time scales
- Well-tempered metadynamics may be sufficient to detect translocation pathways and conformational changes
- Do we believe experiments or computation?
CFTR TH7 and TH8 are possibly mobile
