Antigenic structure of proteins: peptide epitopes

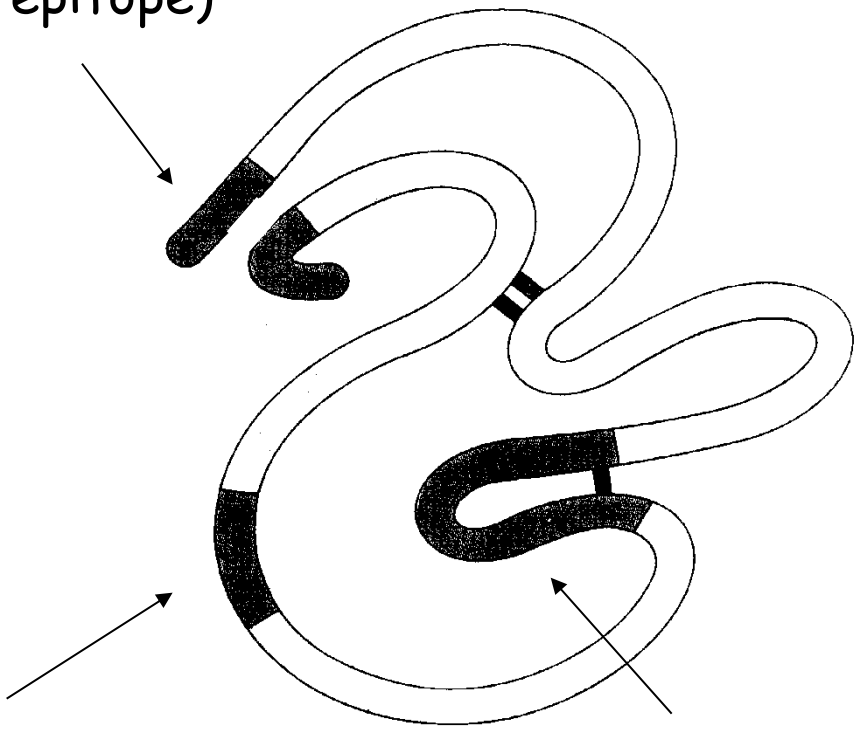
Ferenc Hudecz [1,2]

[1] Research Group of Peptide Chemistry, Hungarian Academy of Sciences, Eötvös L. University,

[2] Department of Organic Chemistry, Institute of Chemistry, Eötvös L. University,

Protein epitopes

Topographic, non-continuous
(antibody epitope)



Linear, sequential
(antibody epitope, T-cell epitope)

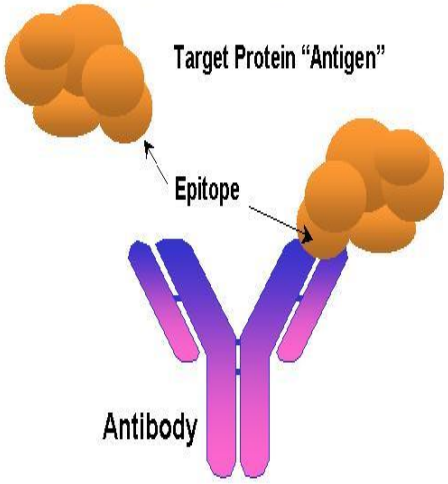
Topographic, continuous
(antibody epitope)

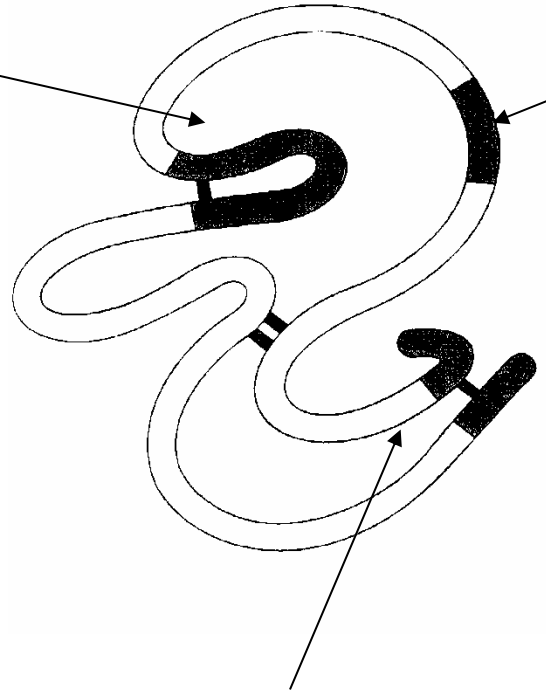
B- and T-cell epitope recognition

Antigen structure - peptide epitopes – epitope recognition

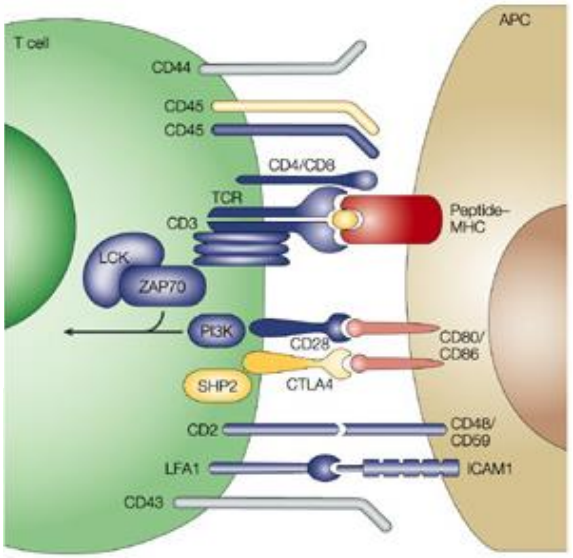
Topographic, non-continuous
(antibody epitope)

Linear, sequential
(antibody or T-cell epitope)

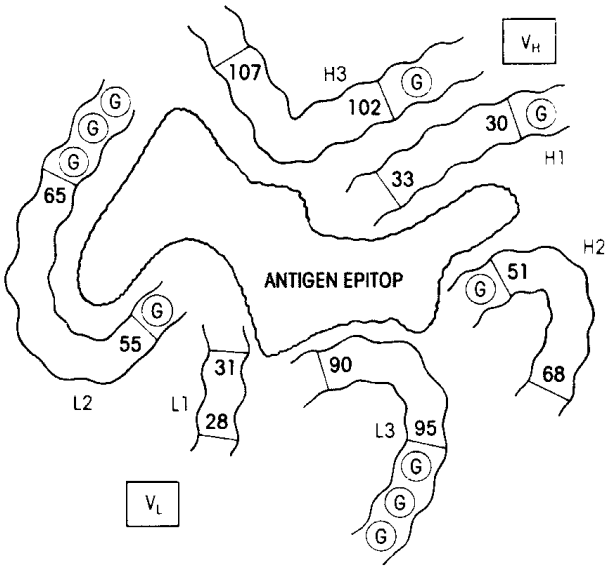




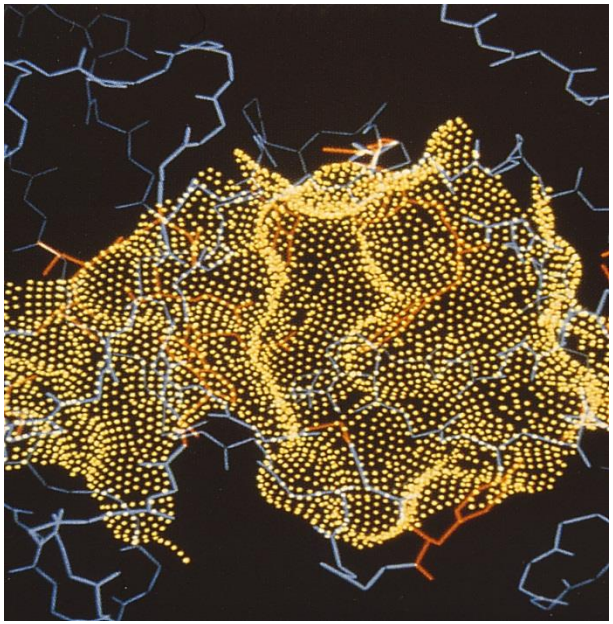
Topographic, continuous
(antibody epitope)

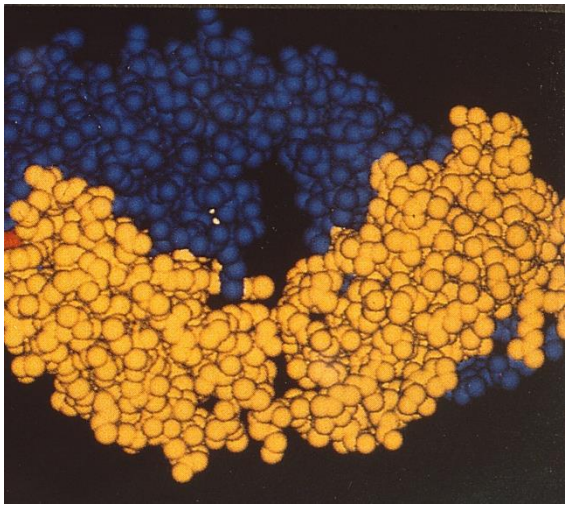


Antibody – epitope interaction



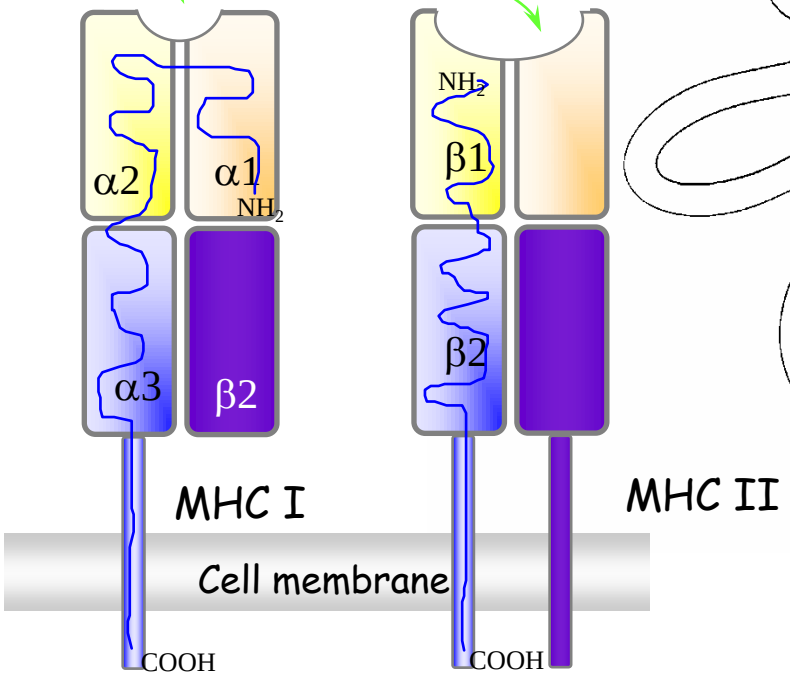
Chothia et al. Nature 342, 877, 1989

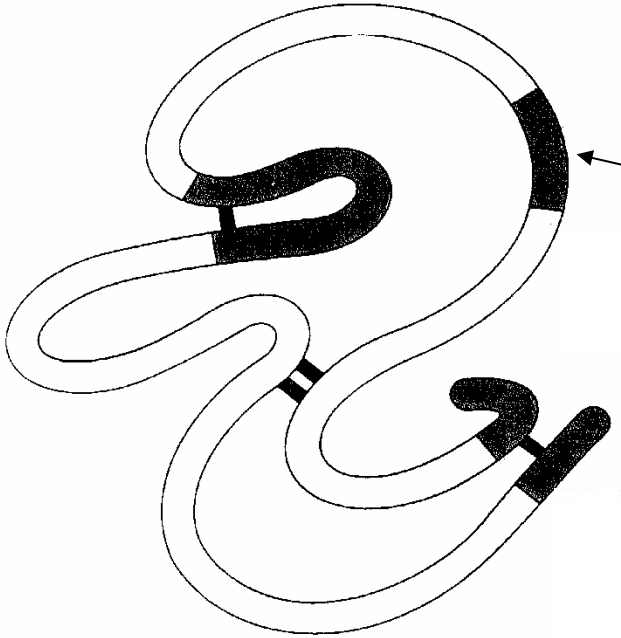




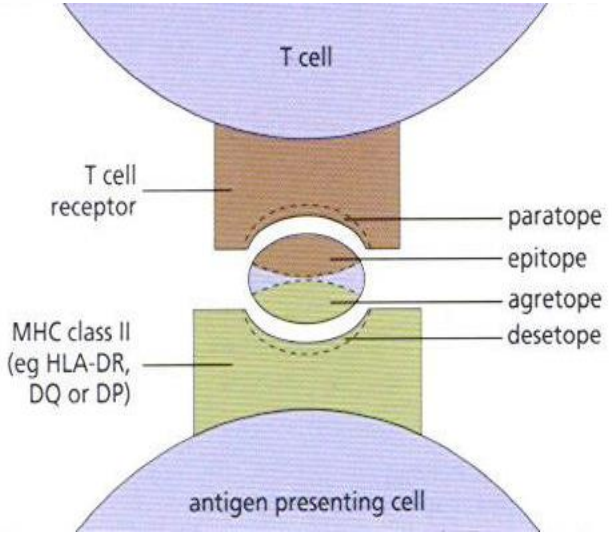
T- cell epitope recognition

binding site





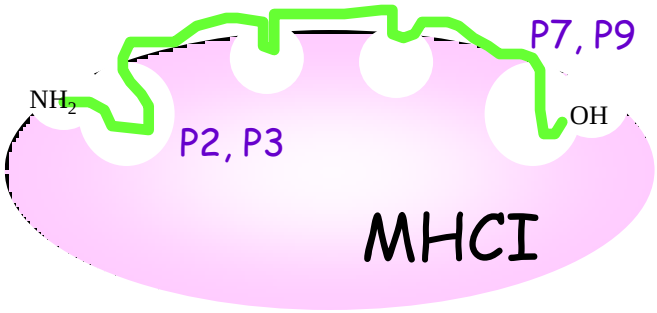
Linear, sequential
(T-cell epitope)



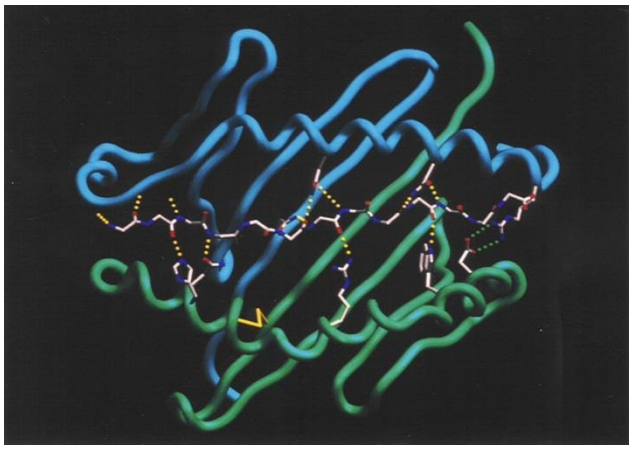
1 polymorf α-chain
β-mikroglobulin

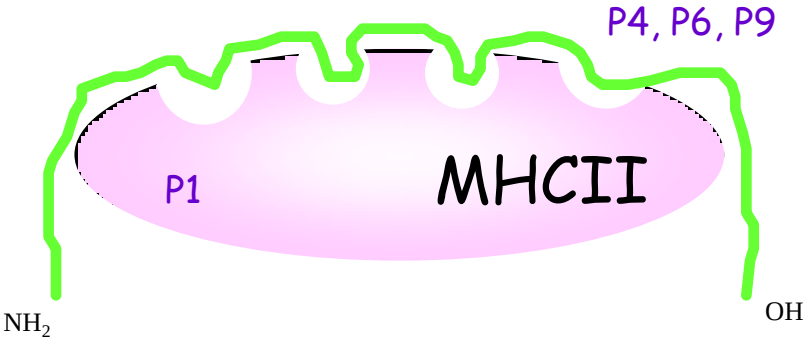
1 polymorf α-chain
1 polymorf β- chain

T- cell epitope recognition

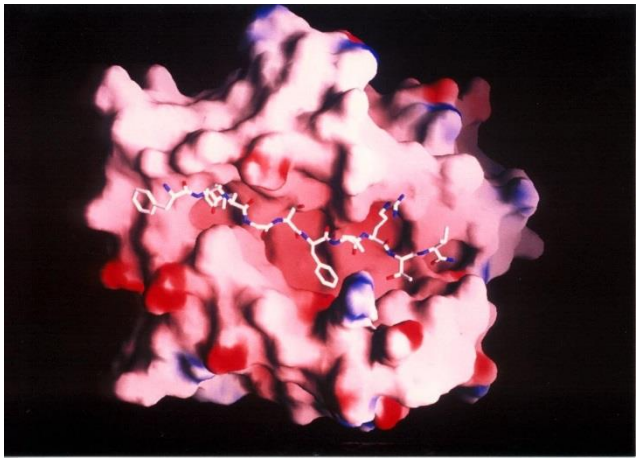


MHC I : 8 - 10 amino acid

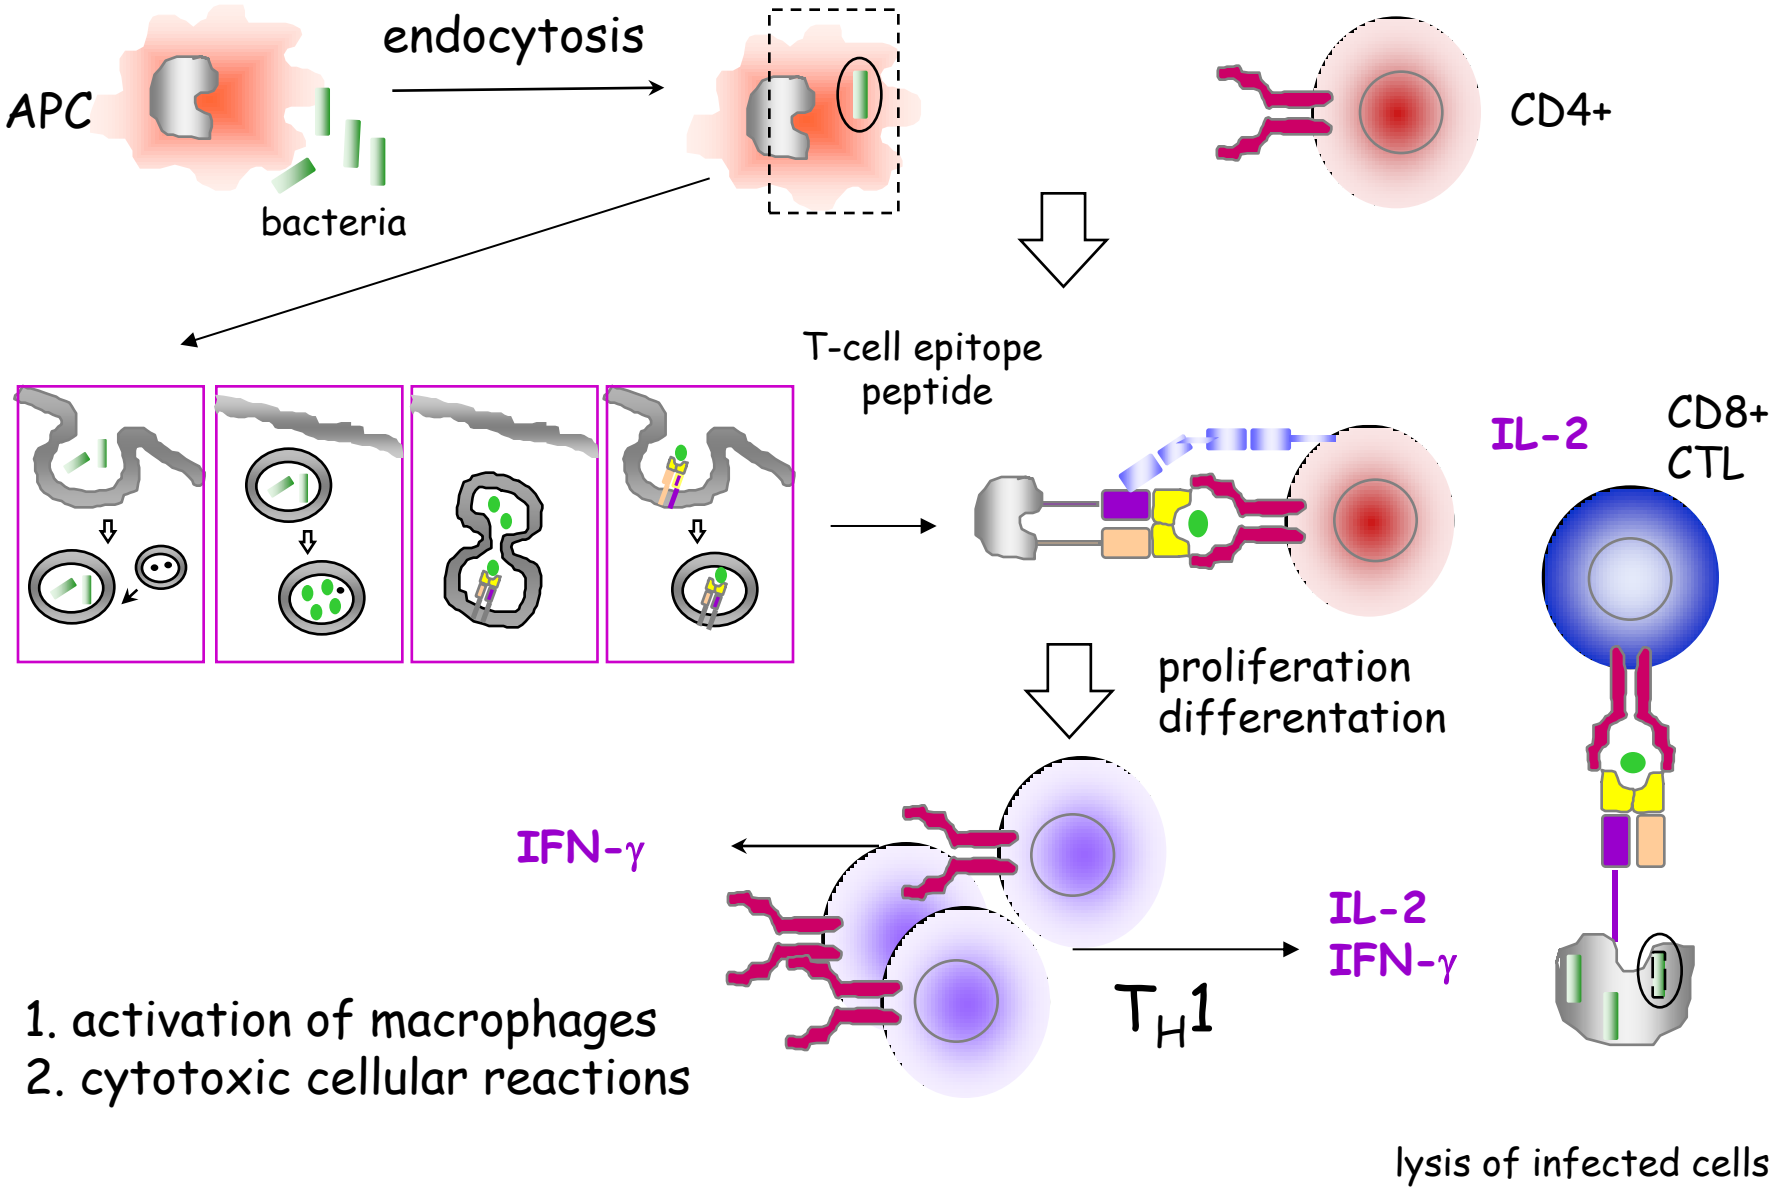




MHC II : 13 - 23 amino acid

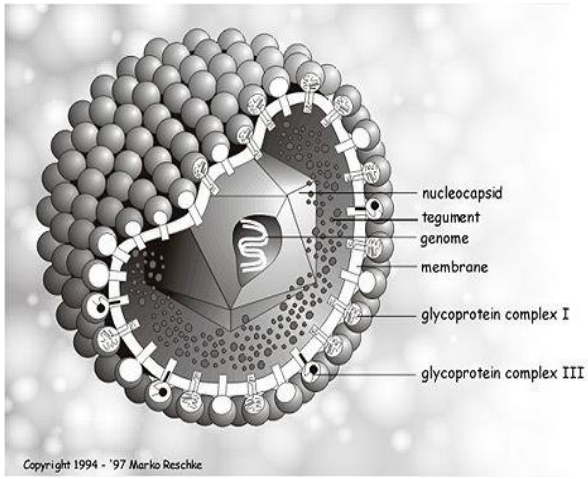


Development of immune response against T-cell epitopes



Identification of protein epitopes

Identification of protein epitopes

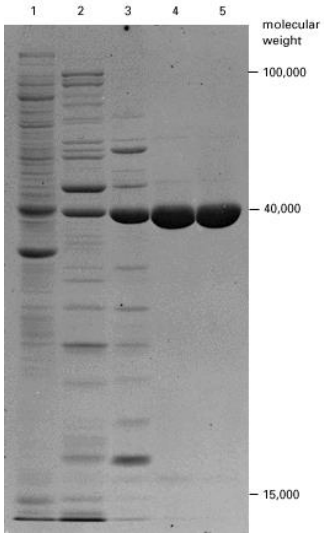


virus

Víral envelope proteins (mixture)

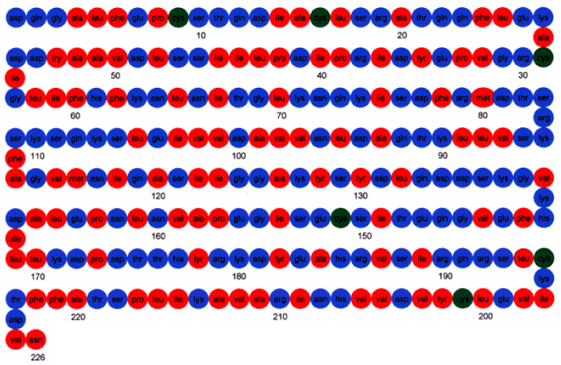
1. Affinity chromatography
2. Gradient centrifugation

Immunoprecipitation (Gelelectrophoresis)

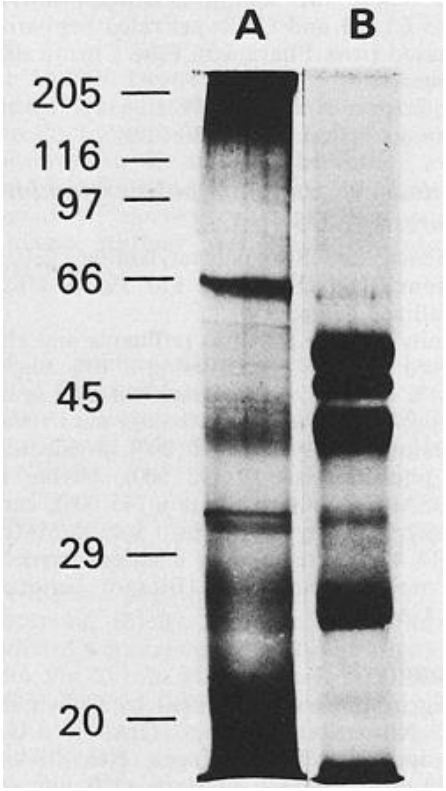


Immunodominant protein component(s)

Sequencing



Amino acid sequence



Vaccine, Vol. 3, September 1985

Preparation of highly purified human cytomegalovirus envelope antigen

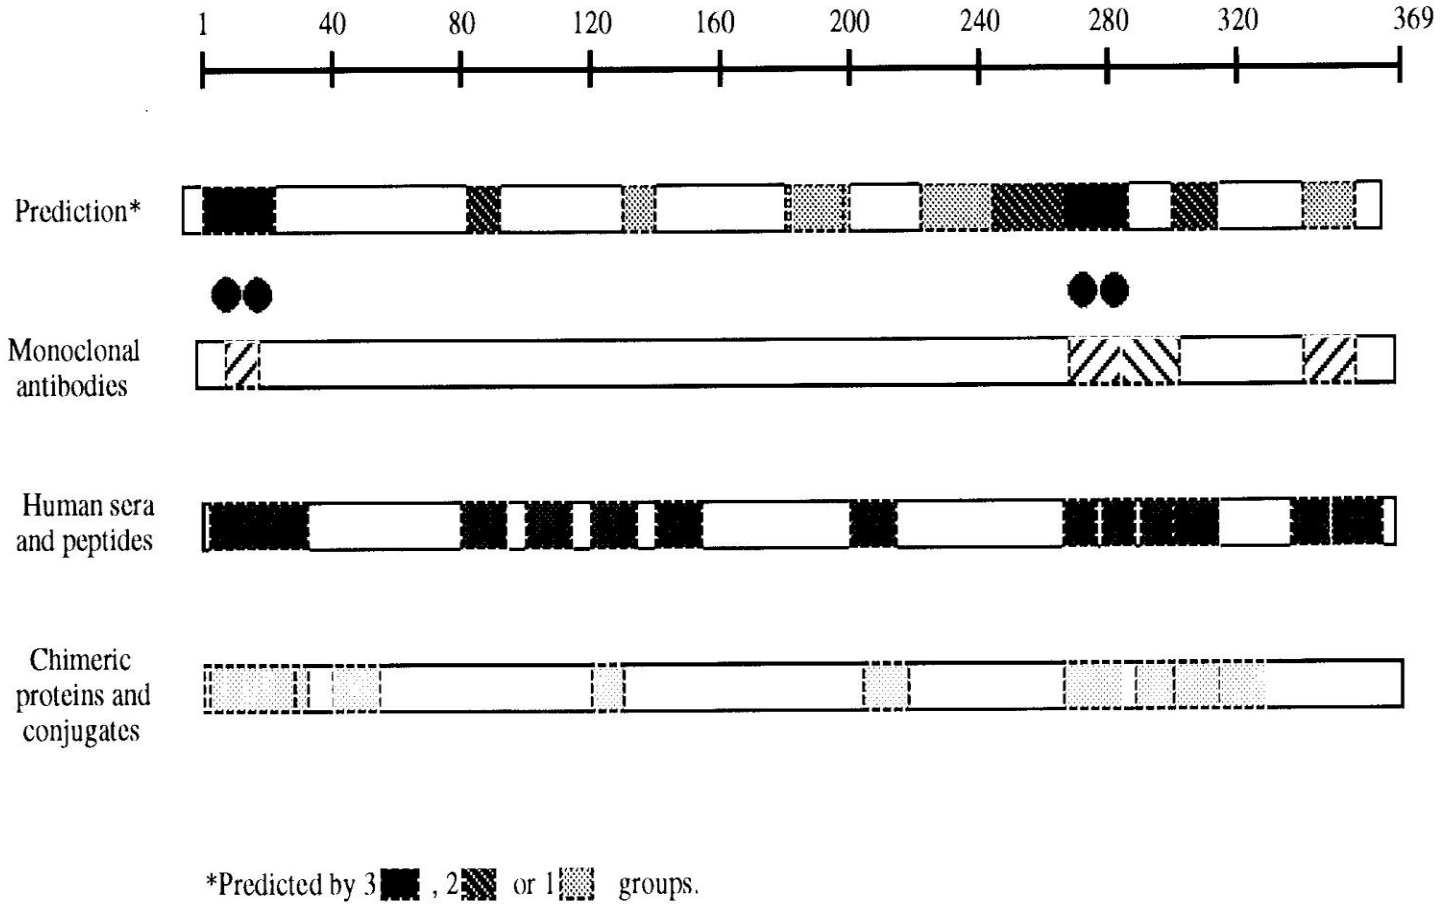
Comparative analysis



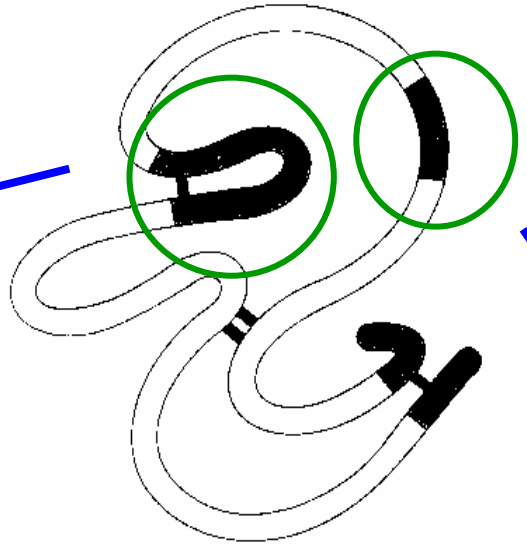
In: Synthetic peptides in the search for B-and T-cell epitopes. (Ed. Rajnavölgyi, É.) 1994, R.G.Landes Company, Austin, pp. 157-169.

Structural modification of protein epitopes

Modification of epitope structure: why and how?

- Improve immune recognition
- Protection against enzymatic degradation

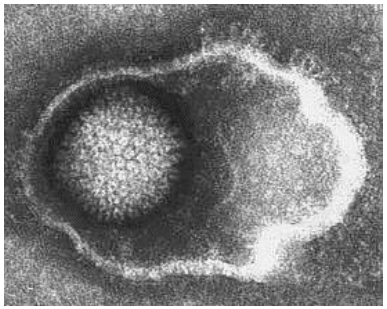
„Flanking" regions



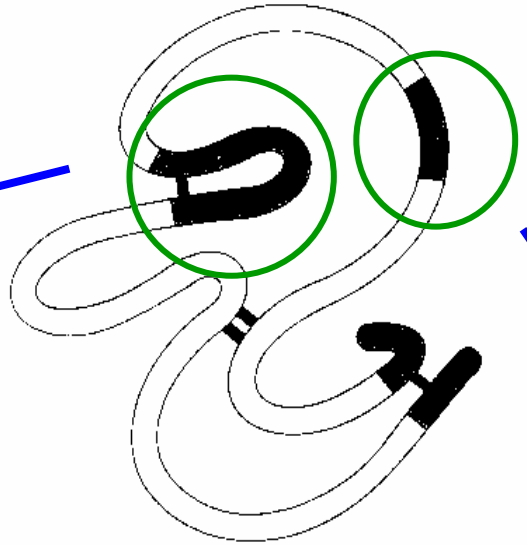
„Restricted" conformation
- cyclopeptides
- „scaffold" chimera

Multiplication
- polymerisation
- conjugation

Modification of B-cell epitopes



HSV gD epitope cyclisation

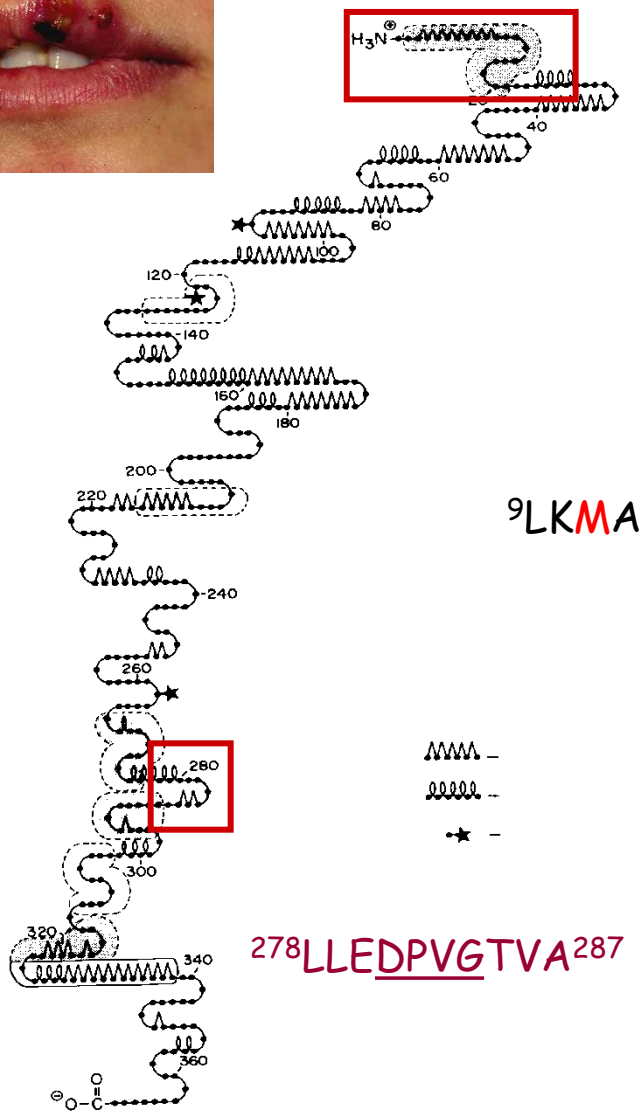


„Flanking" regions

„Restricted" conformation
- cyclopeptides
- „scaffold" chimera

Multiplication
- polymerisation
- conjugation

Identification of HSV gD-1 epitopes



^{278}LLEDPVGTVA^{287}

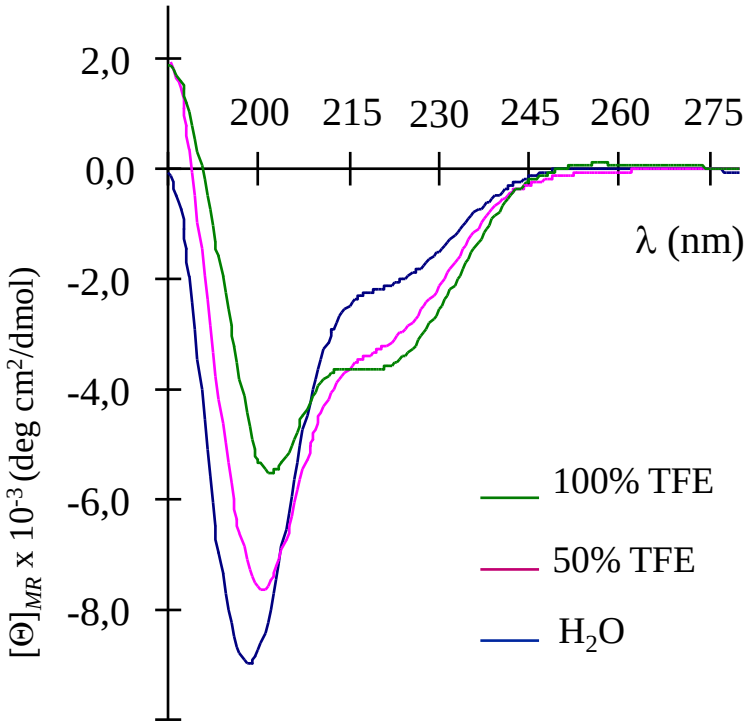
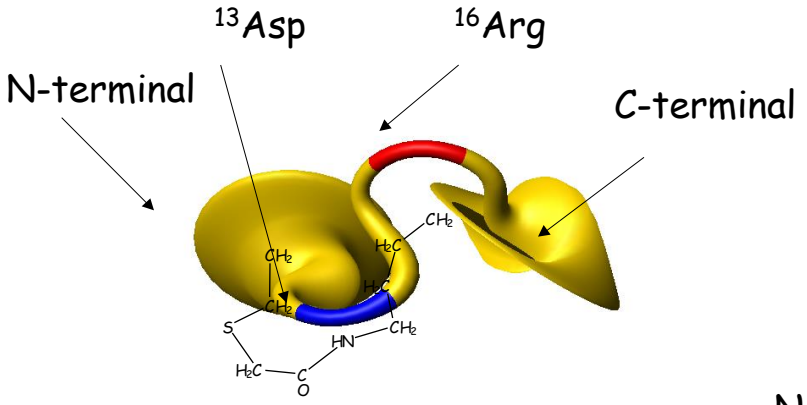
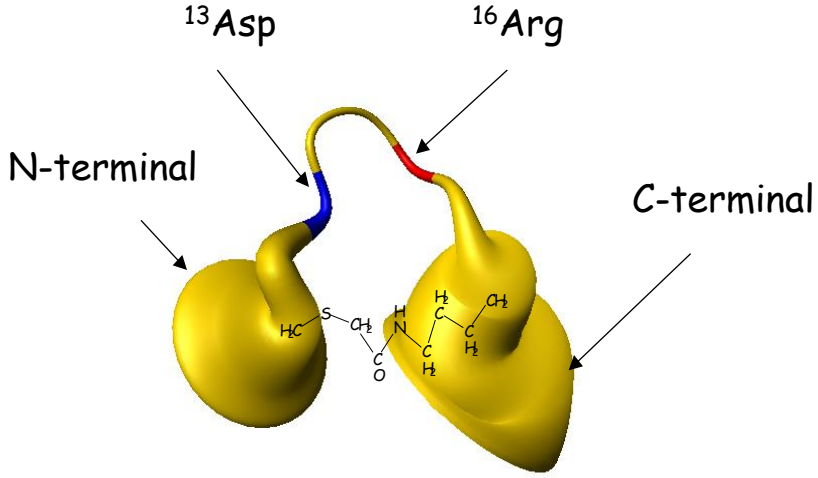
LKc[HcyADPNRFK]GKDL

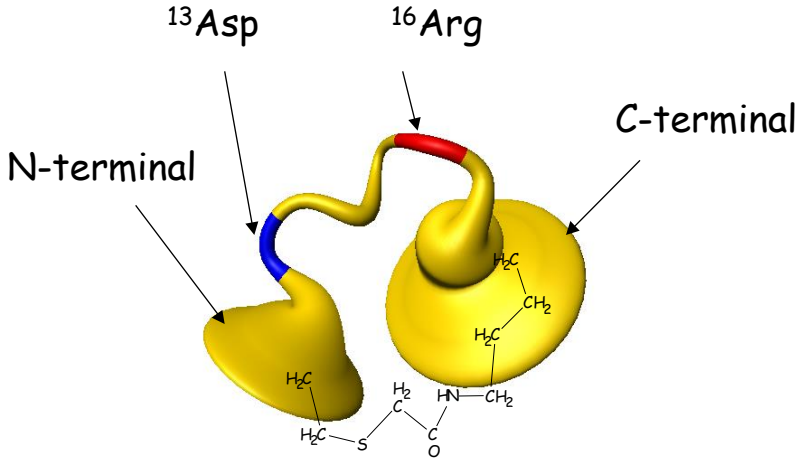


LKc[CADPNRFK]GKDL

Solution structure of the cyclopeptides







Epitope cyclization:

effect of linkage type on enzymatic stability

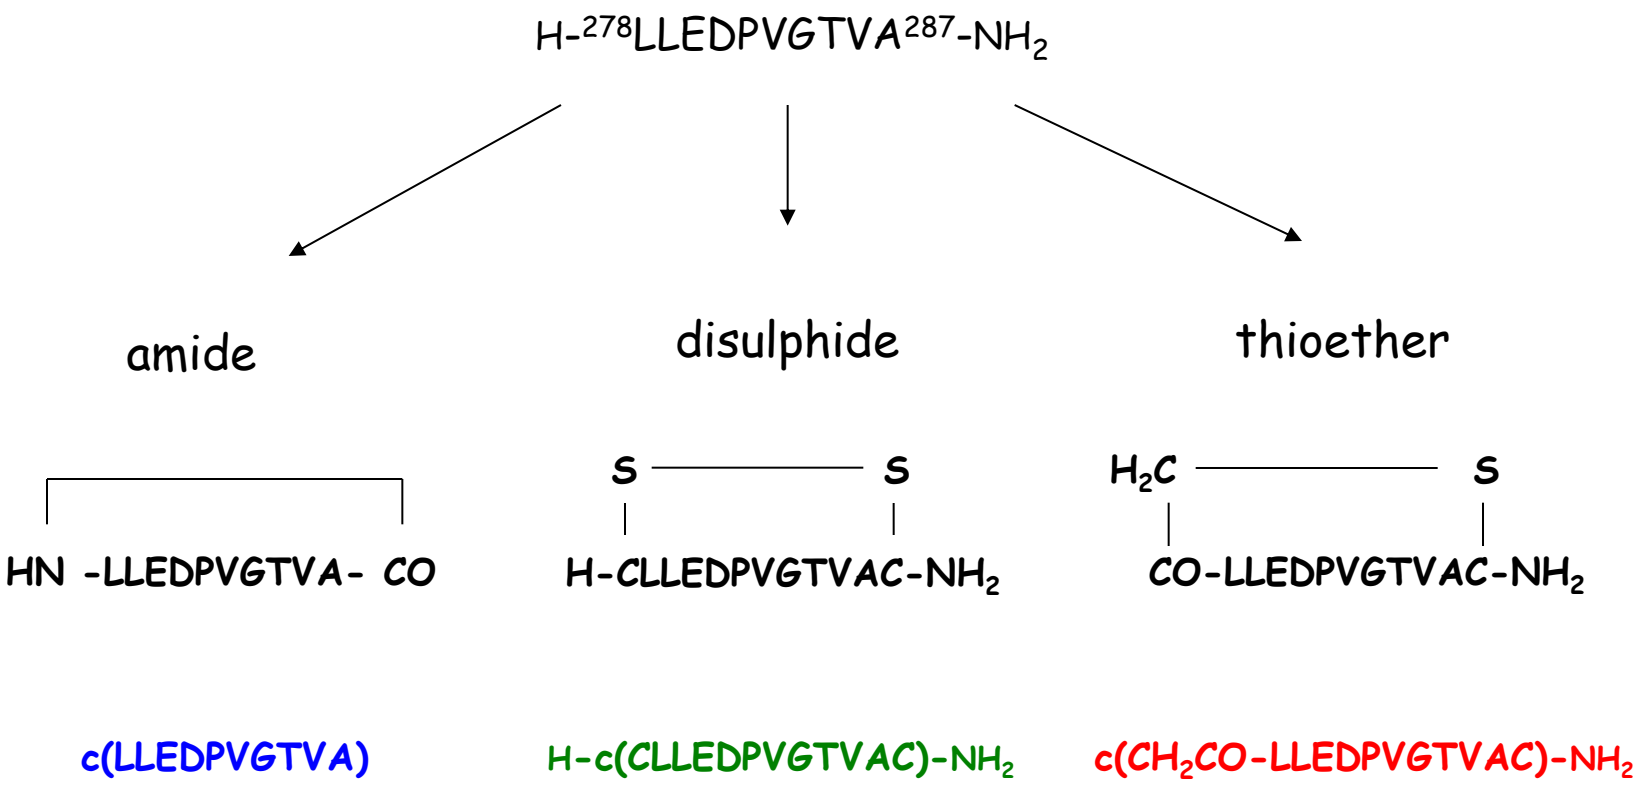
Predicted secondary structure of gD

Epitope peptide:

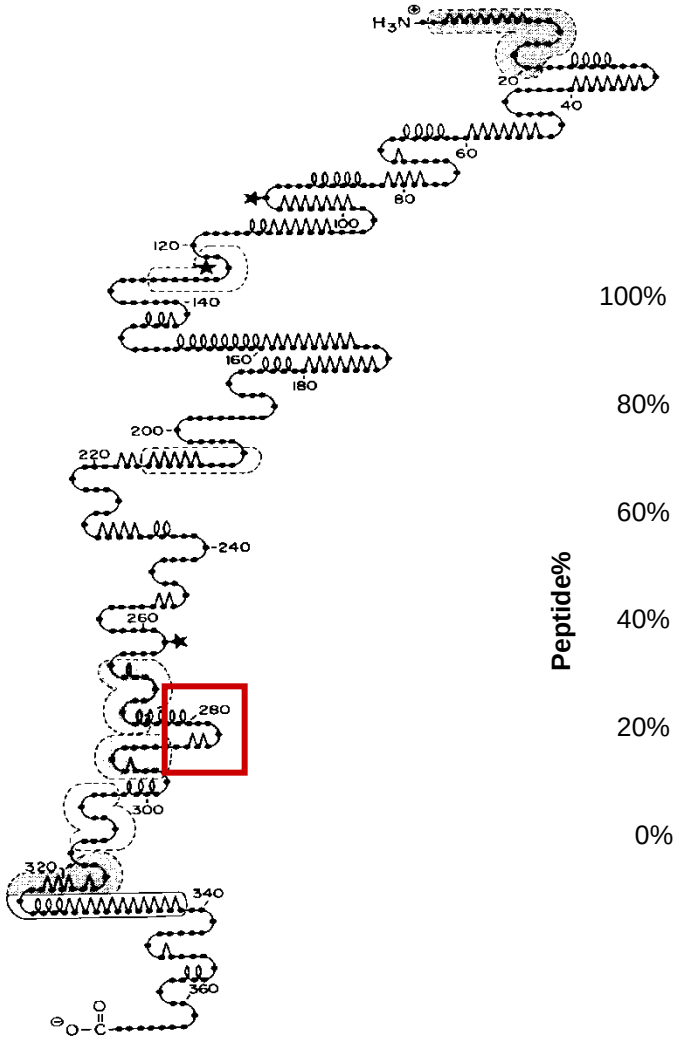
^{278}LLEDPVGTVA^{287}

DPVG is a core epitope

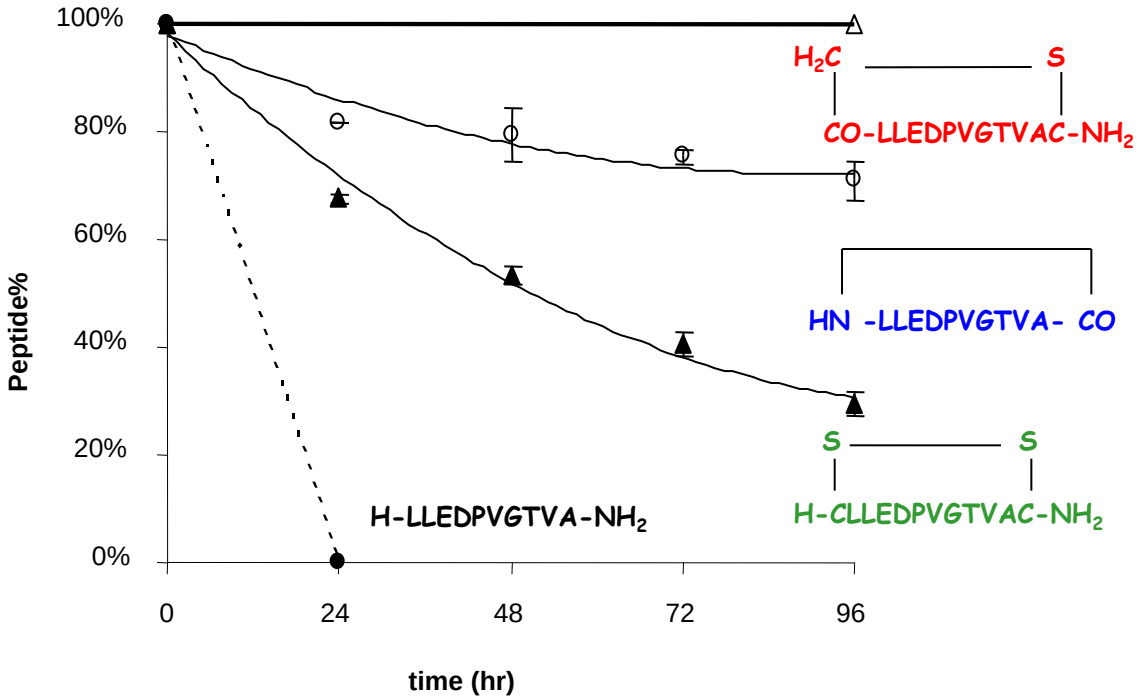
Cyclic peptides derived from 278-287 sequence of HSV gD



Increased enzymatic stability

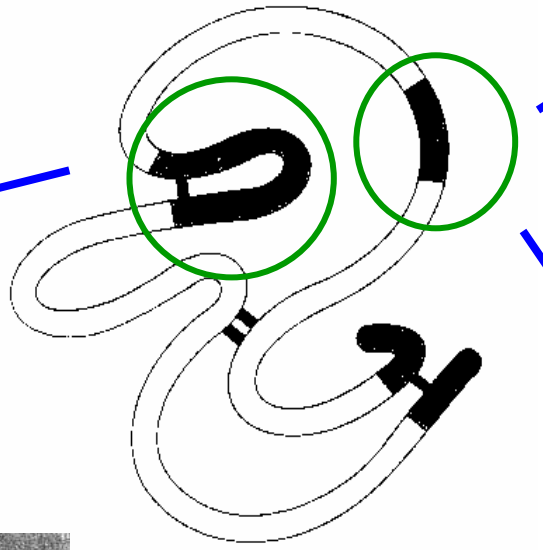


- Tioether linkage
- Amide linkage
- Disulfid linkage

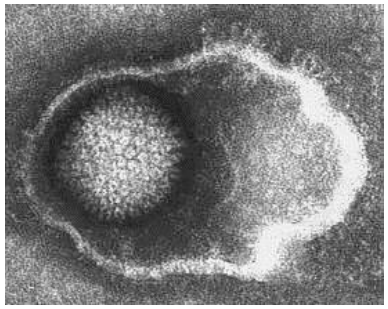


Stabilisation/optimalisation of epitope recognition

„Flanking" regions



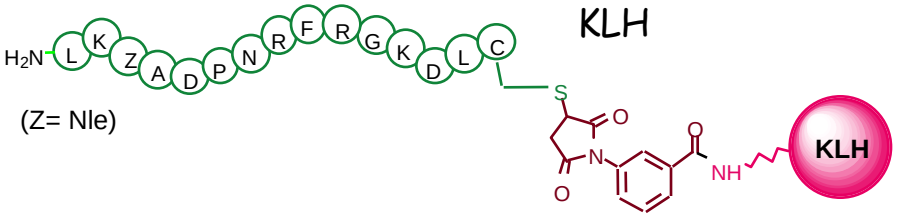
„Restricted" conformation
- cyclopeptides
- „scaffold" chimera

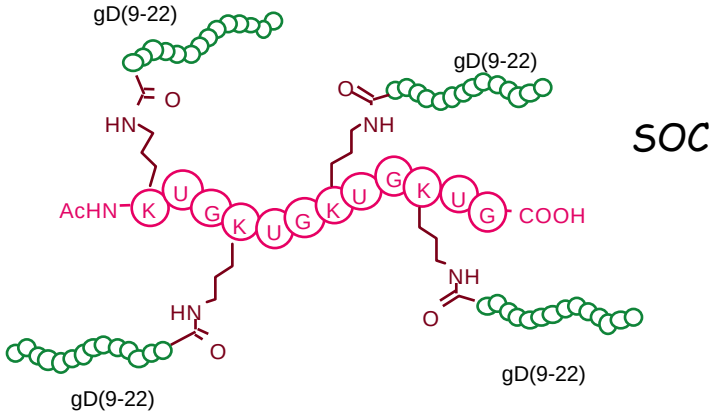


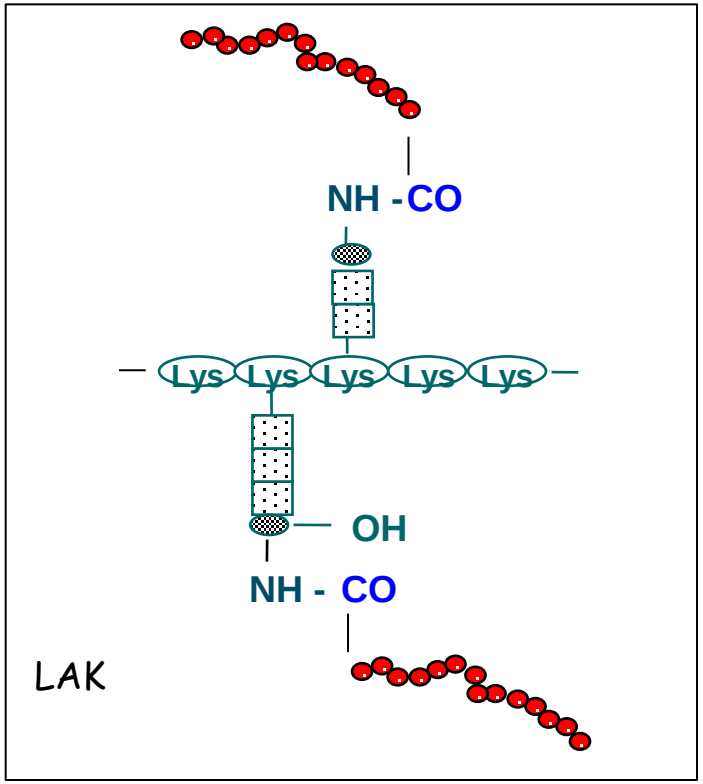
HSV gD epitope multiplication

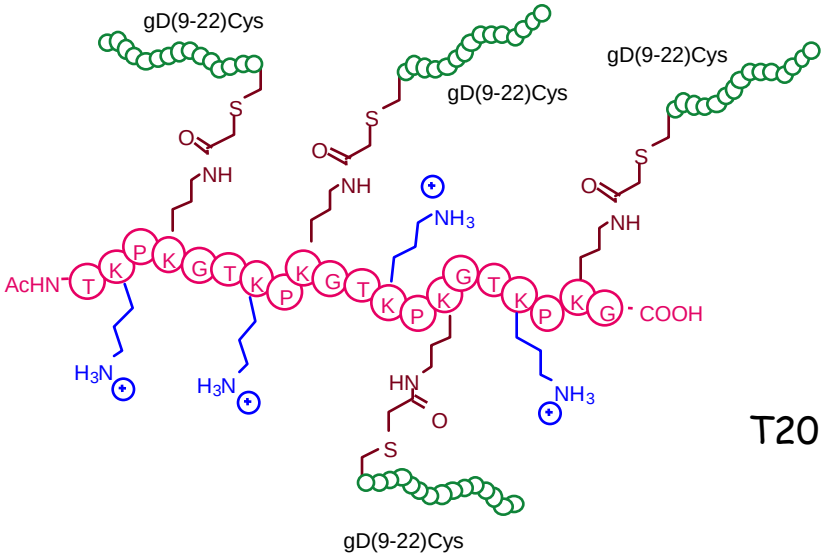
Multiplication
- polymerisation
- conjugation

Multivalent epitope - conjugates





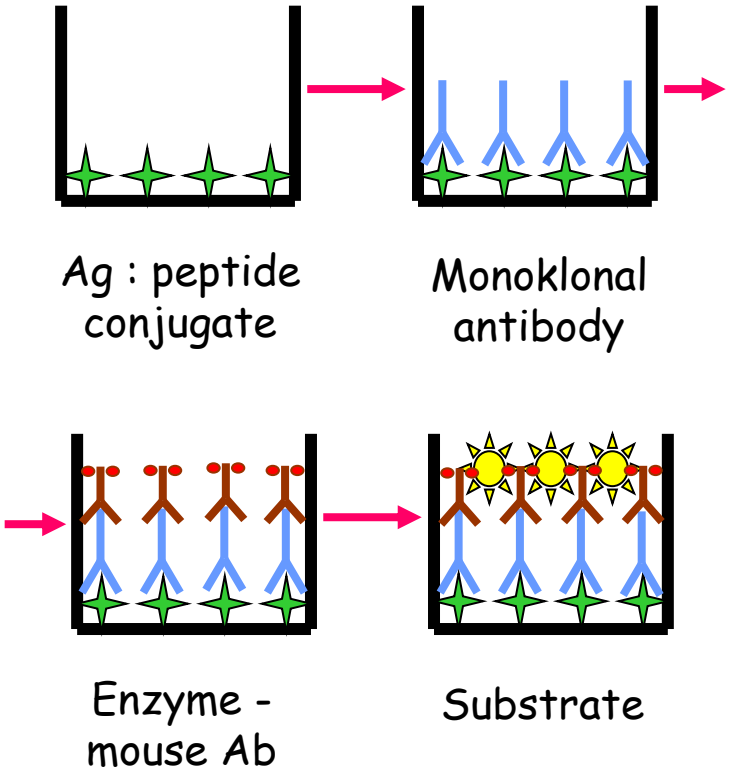


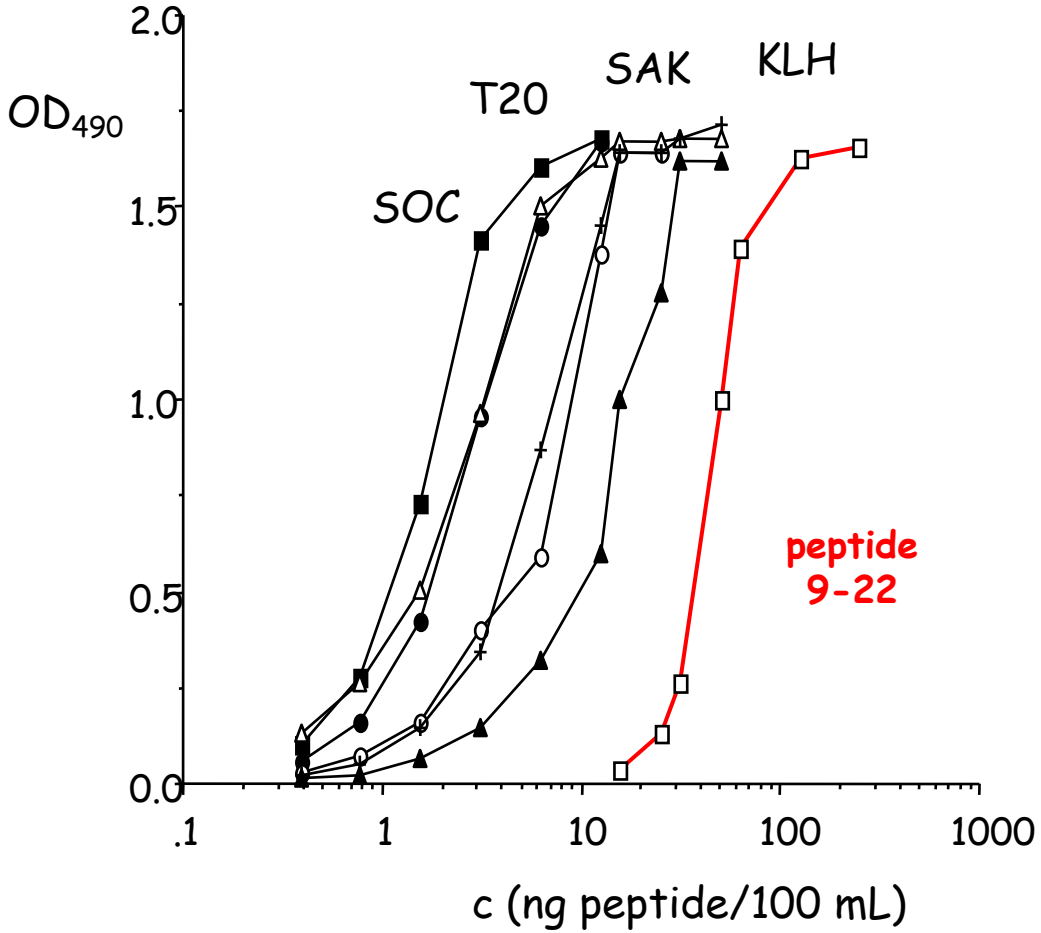


Epitope multiplication:

effect of the carrier component on antibody recognition

Antibody binding of HSV gD epitope (9-22) conjugates
(direct ELISA)

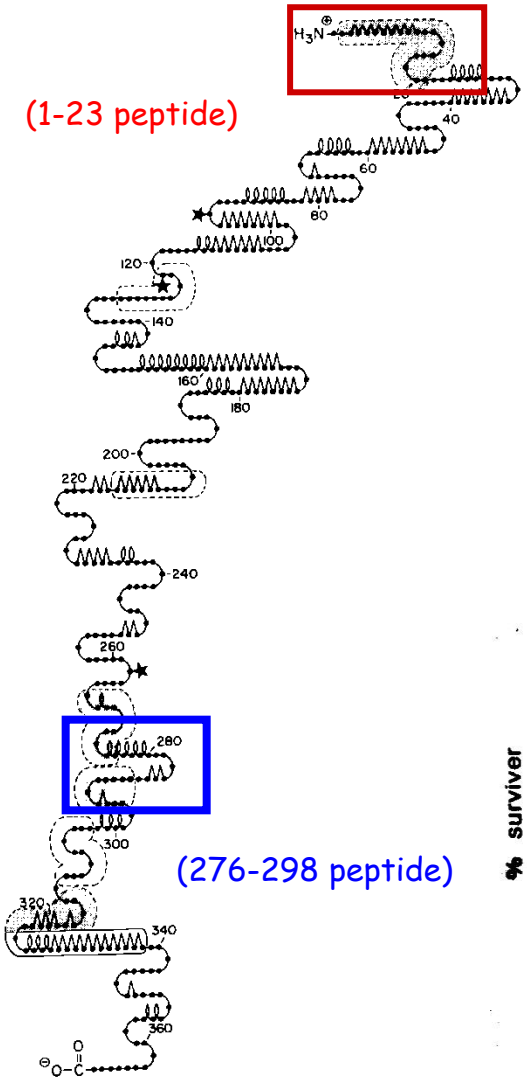




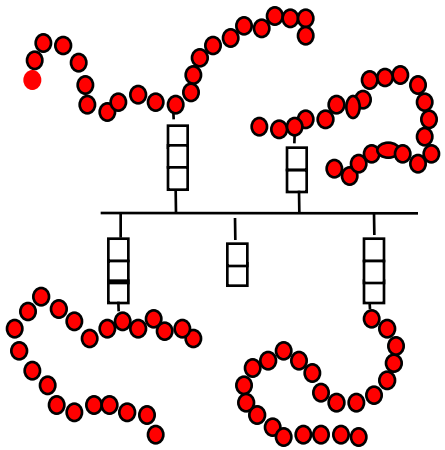
Epitope multiplication:

effect of carrier component on immune protection

Protection against lethal infection by HSV-1

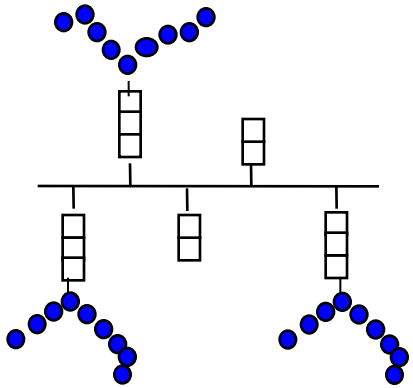


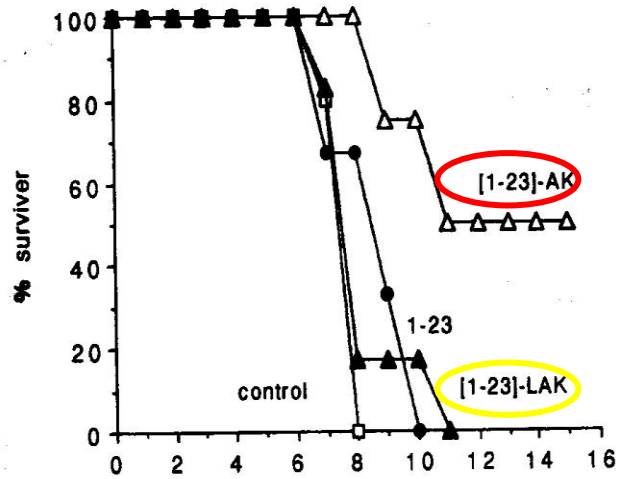
(1-23 peptide)

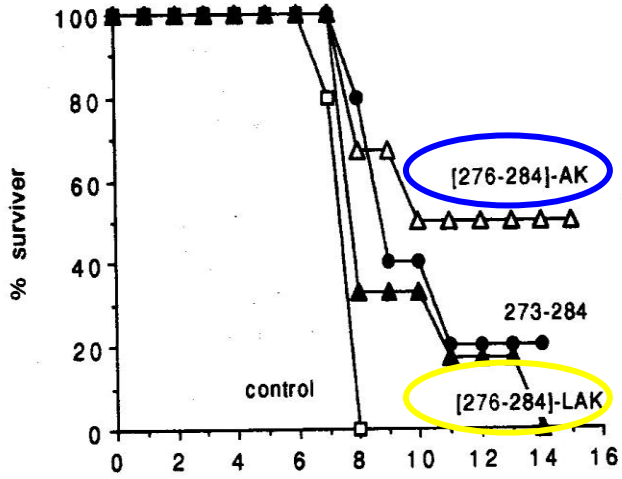


AK vs LAK

(276-284 peptide)



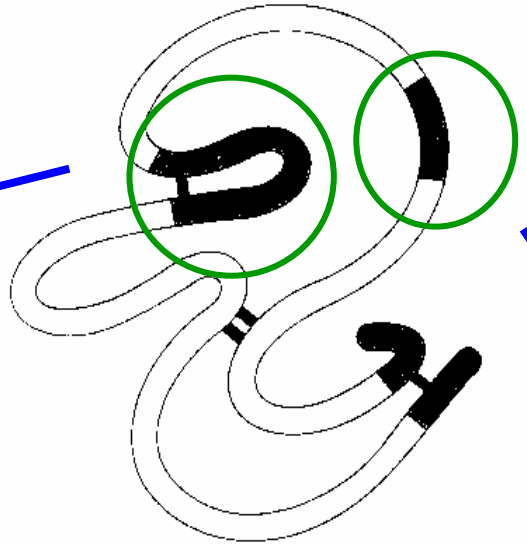




Balb/c mice, survival after lethal infection

Stabilisation/optimalisation of epitope recognition

„Flanking" regions



MUC2 epitope modification

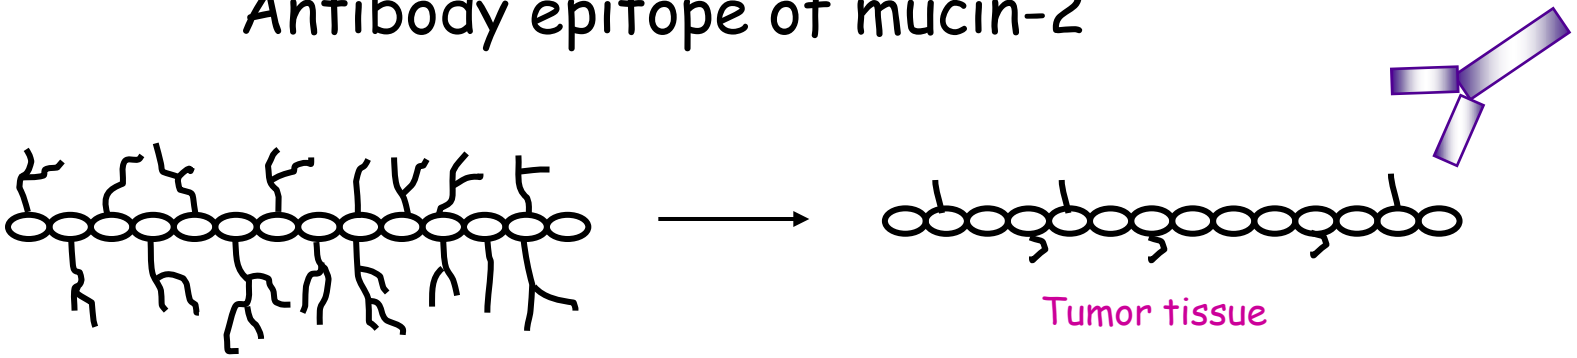
„Restricted" conformation
- cyclopeptides
- „scaffold" chimera

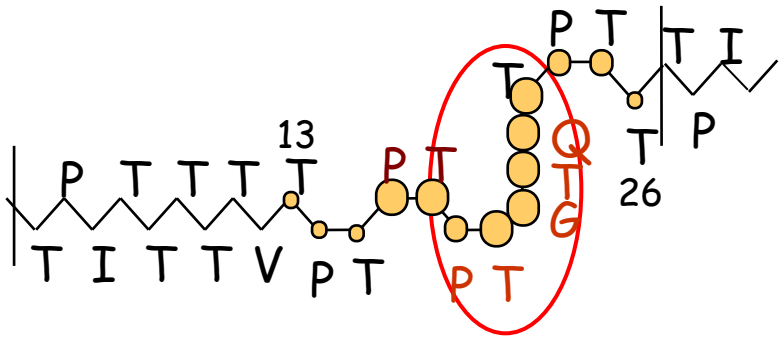
Multiplication
- polymerisation
- conjugation

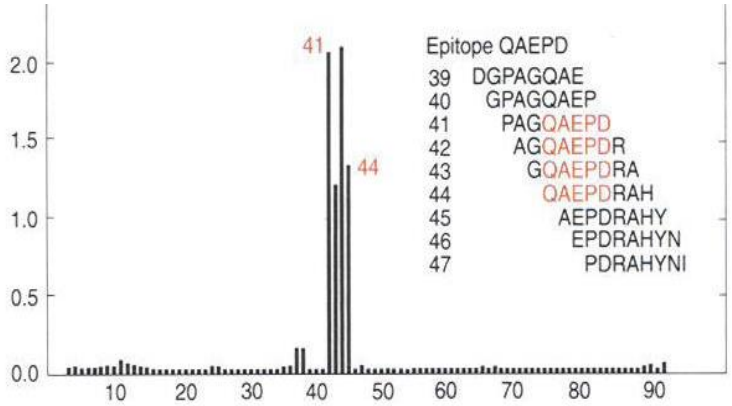
Flank substitution:

effect of D- amino acid(s)
on enzymatic stability and antibody binding

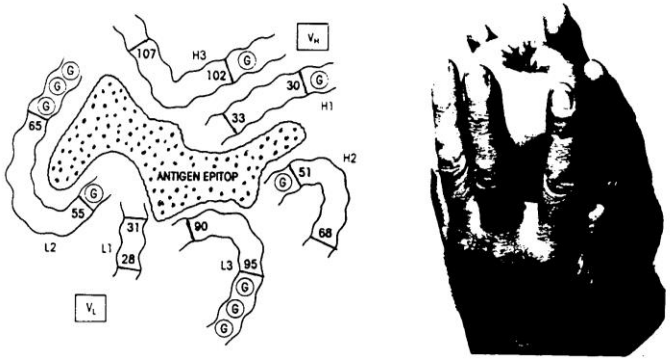
Antibody epitope of mucin-2







^{1}TPITTTTTVTPTPTPTGTQTPTT^{26}



The concept: epitope „core" and „flanking" regions

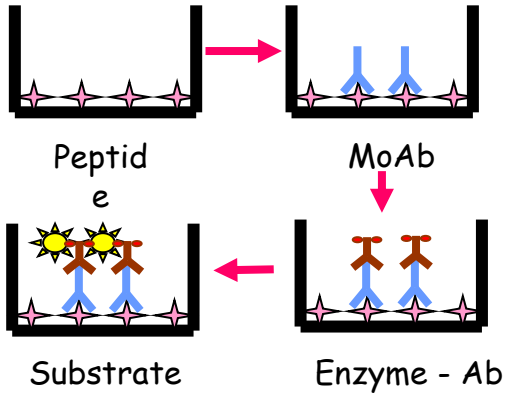
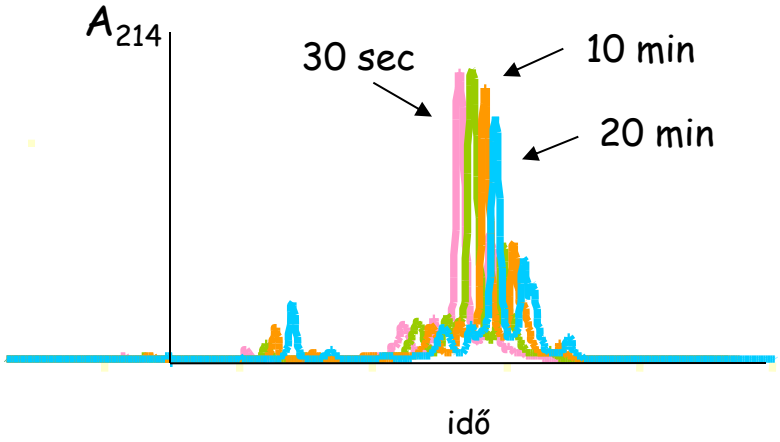
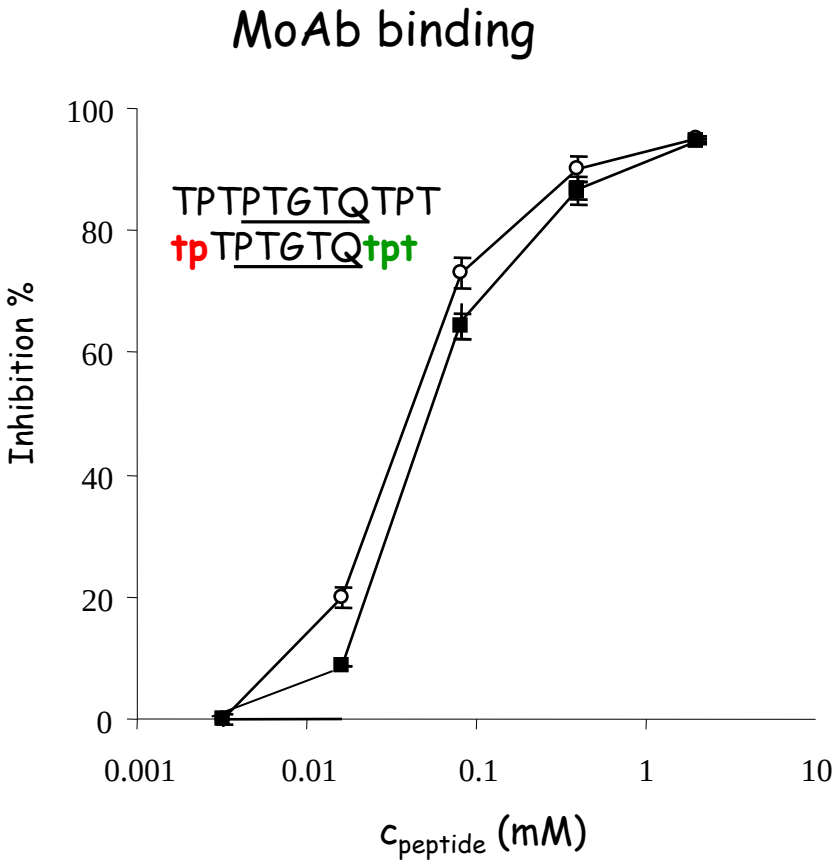
2. Antibody binding



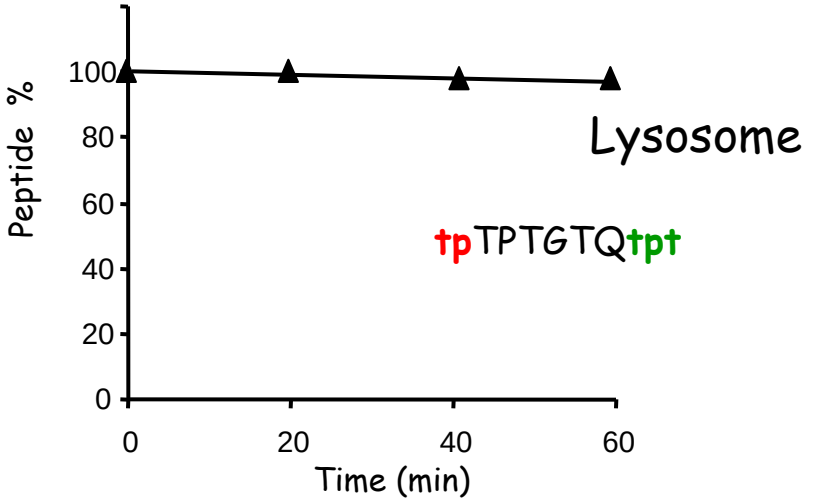
3. Enzyme stability
   - human serum
   - lysosome preparation

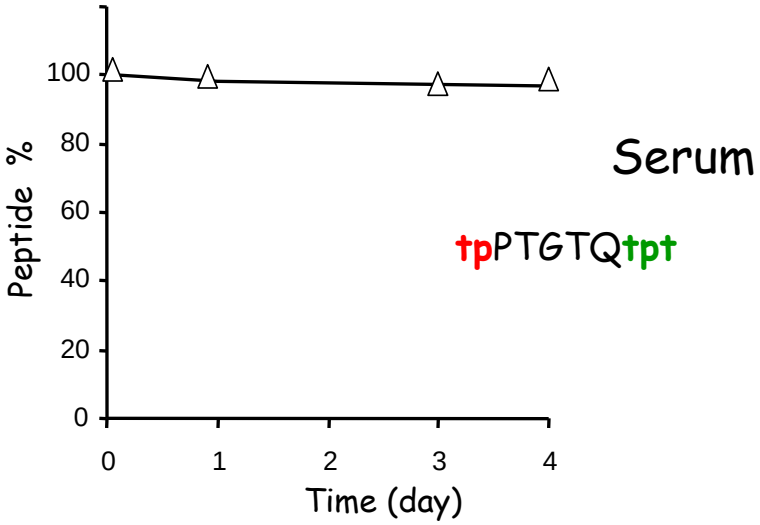


Modification in the „flanking" region: binding and enzyme resistance

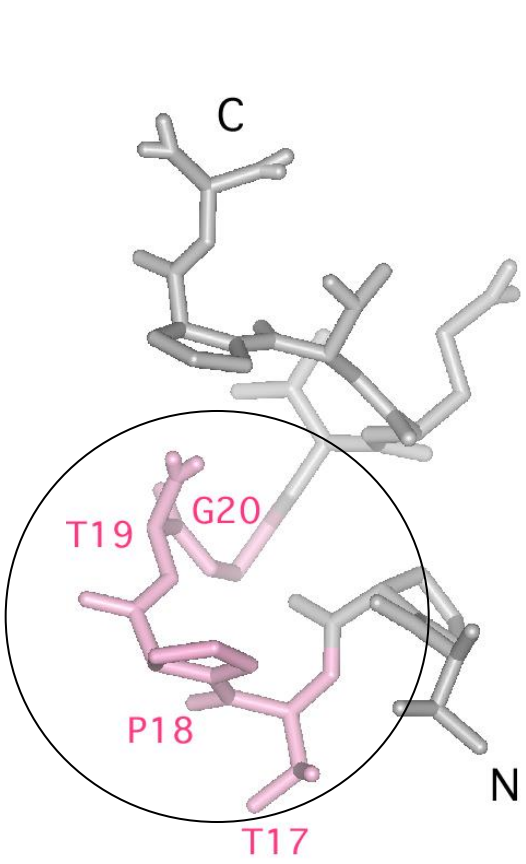


tpTPTGTQtpt

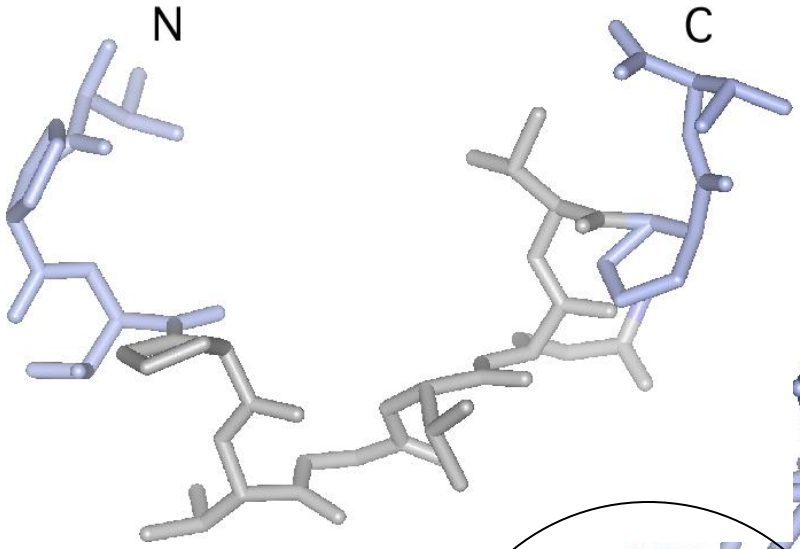




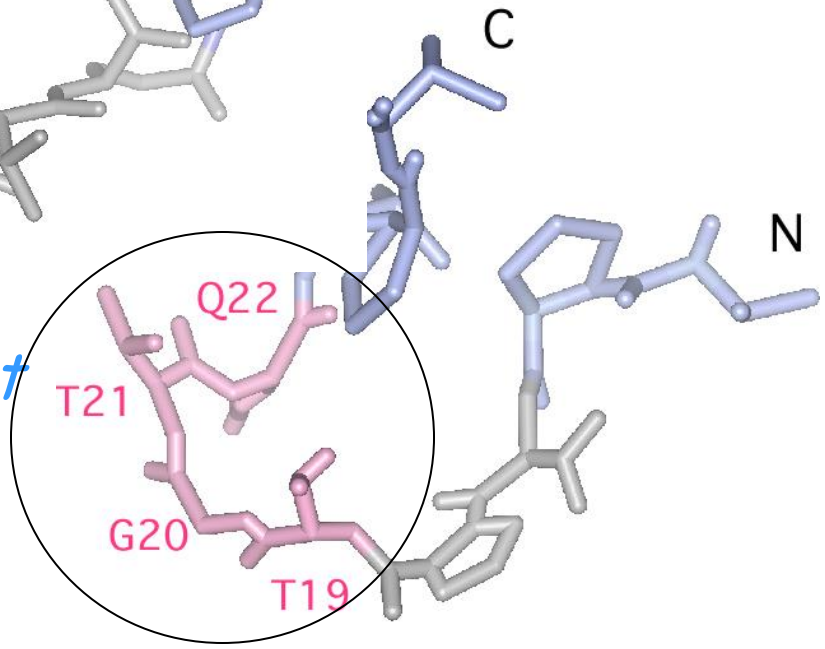
Secondary structure of D-amino acid substituted peptides
(based on NMR)



TPTPTGTQTPT



*tpt*PTGTQT*pt*



*tp*TPTGTQ*tpt*

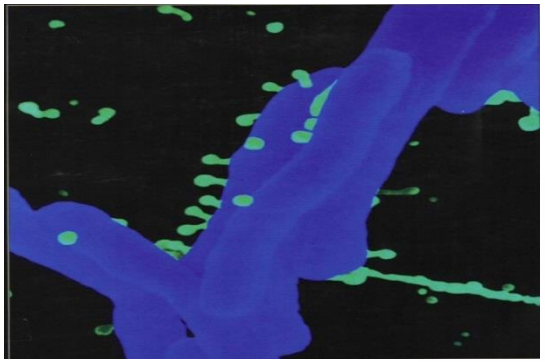
Conclusions

1) The influence of the flanking amino acids could be „sensed" and utilized for antigen design.

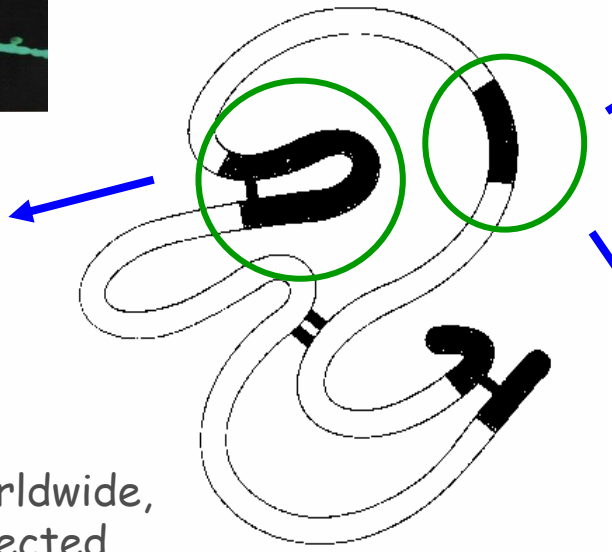
2) Epitope binding (antigenicity) as well as enzyme stability could be optimized by changes in the flanking sequences by
   - non-native, but proteogenic amino acid
   - D-amino acid substitutions

3) Epitope peptide stable in human serum as well as in lysosome with preserved antibody binding was identified.

Stabilisation/optimalisation of T-cell epitope recognition



„Flanking" regions



Tuberculion epitope modification

„Restricted" conformation
- cyclopeptides
- „scaffold" chimera

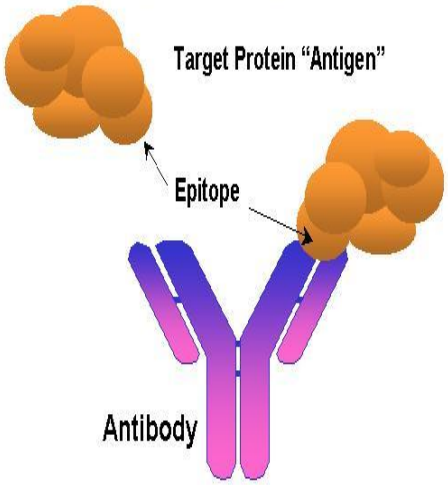
- a leading infectious disease worldwide,
- 2 billion people are latently infected,
- 8 million new TB cases per year (increasing),
- 2 million deaths per year,
- increase of (multi)drug-resistant TB,
- 50 million people infected with drug-resistant TB,
- AIDS

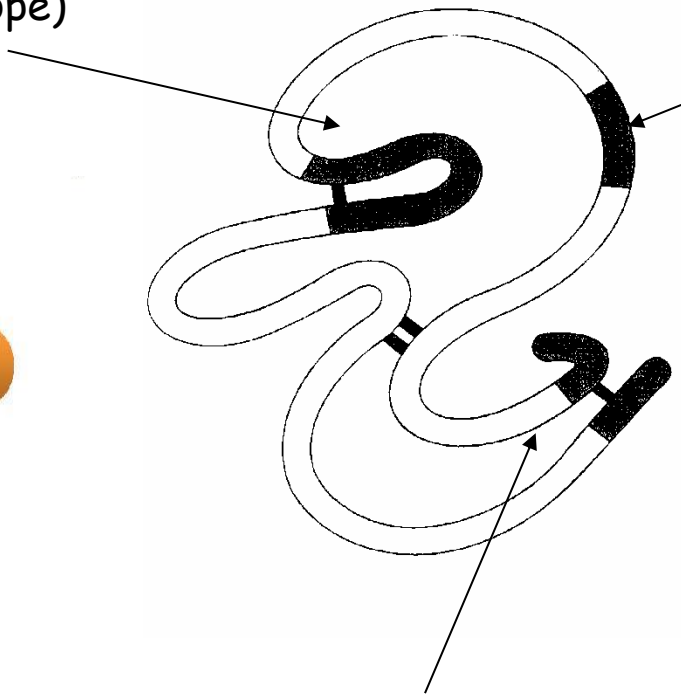
Multiplication
- polymerisation
- conjugation

Antigen structure - peptide epitopes – epitope recognition

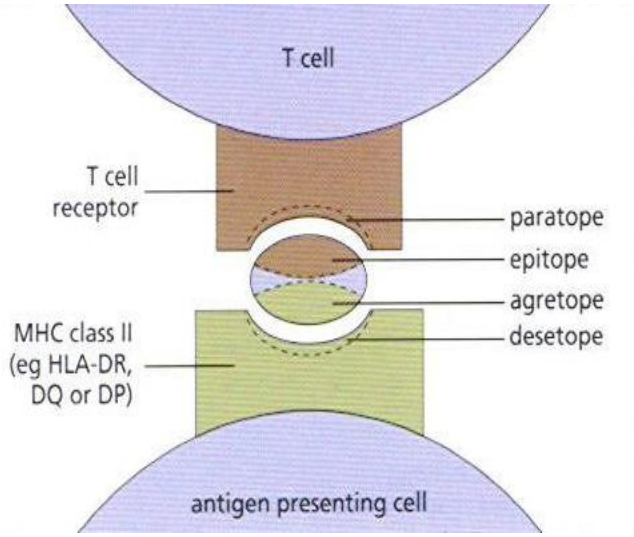
Topographic, non-continuous
(antibody epitope)

Linear, sequential
(antibody or T cell epitope)





Topographic, continuous
(antibody epitope)



T- cell epitope recognition

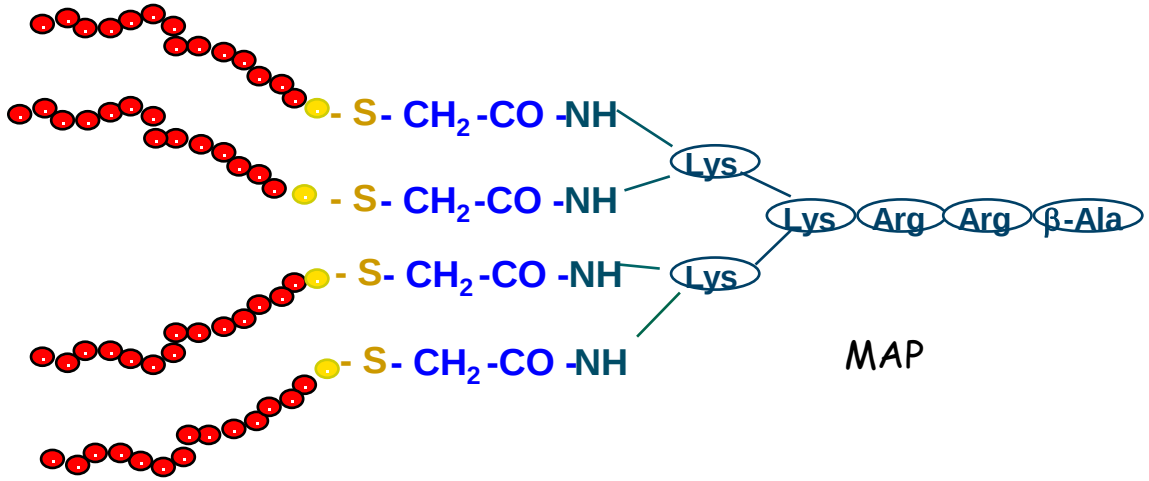
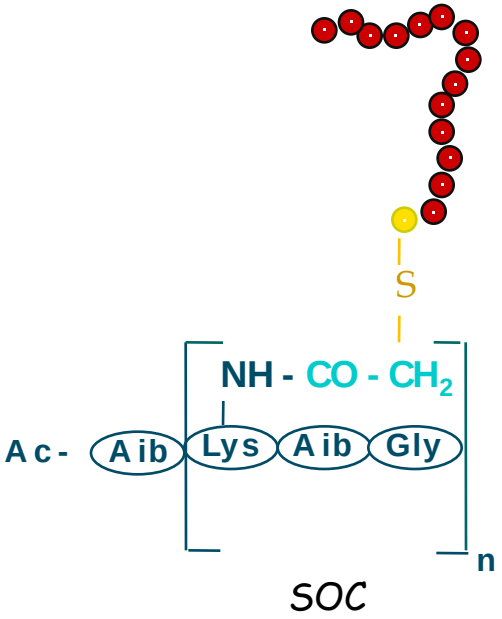
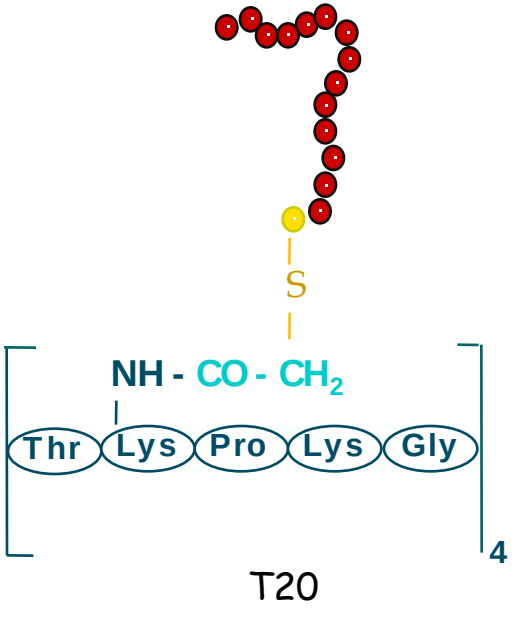
SAK



MAP

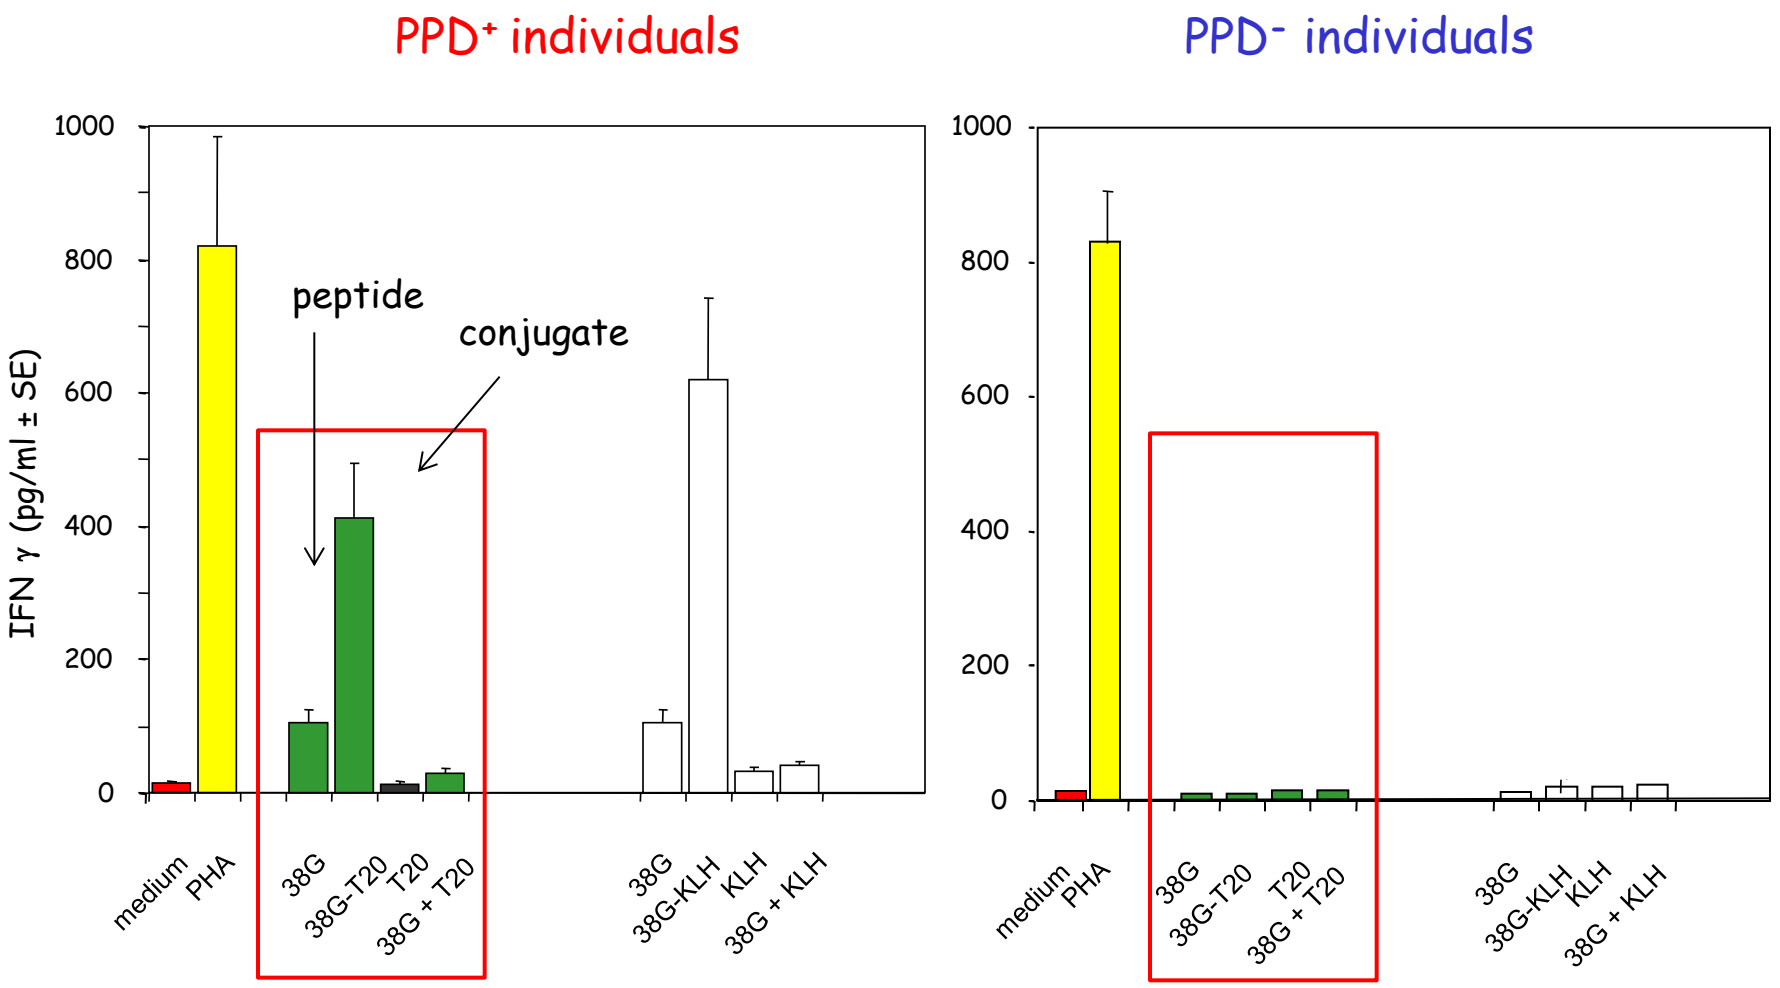


SOC

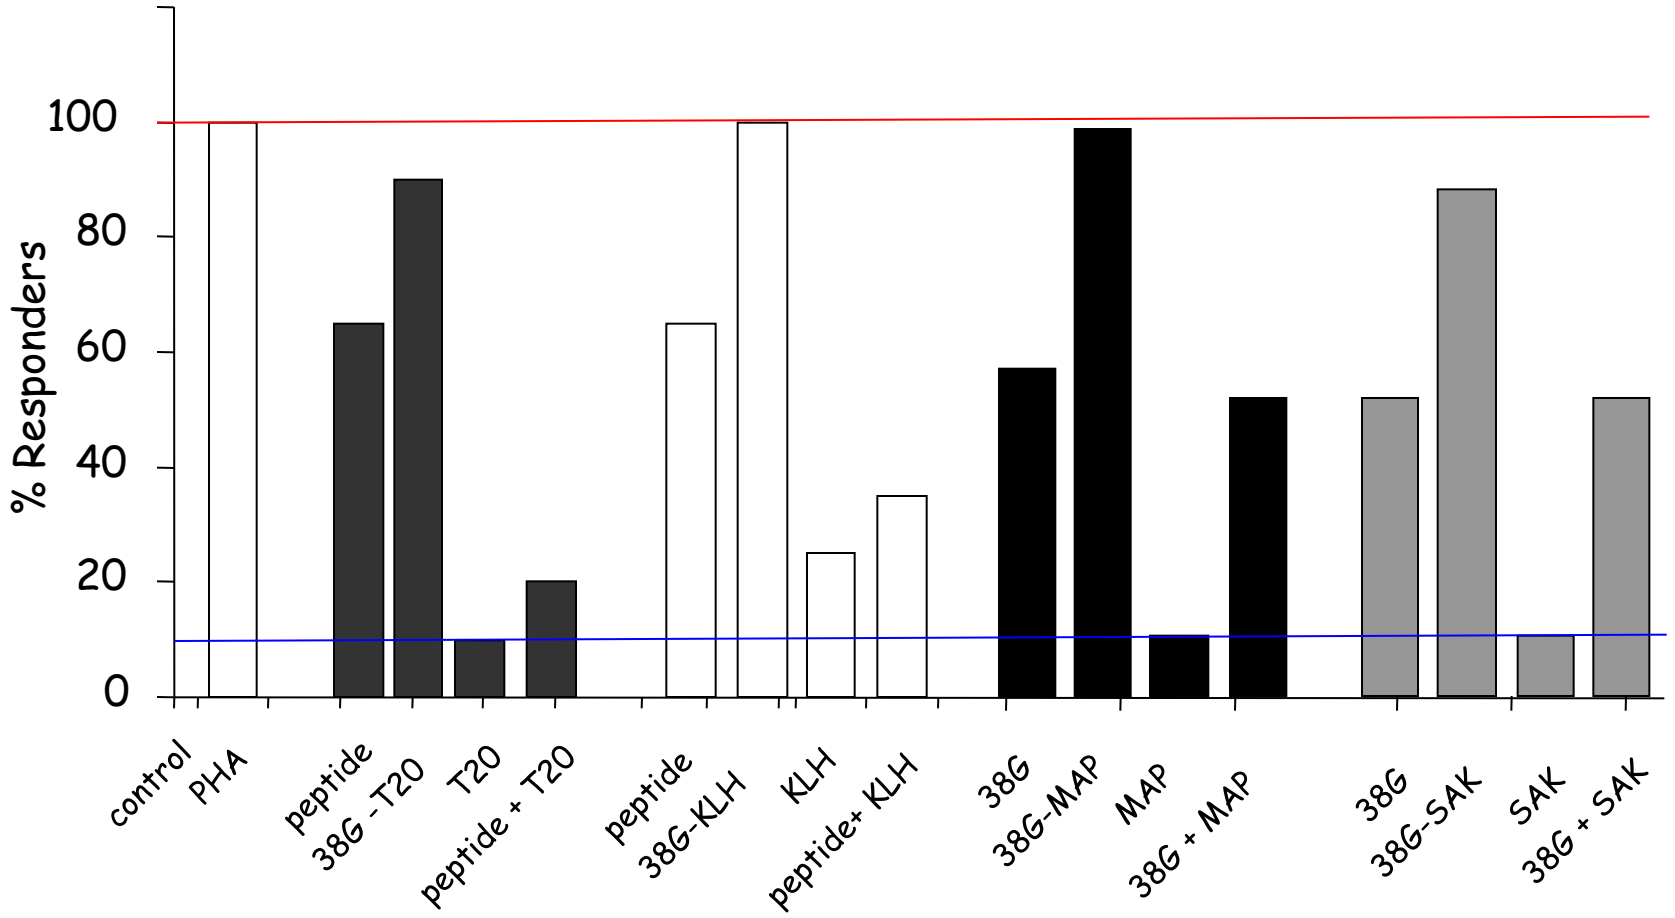


T20

IFNγ production by PBMC from healthy PPD⁺/PPD⁻ subjects stimulated with ^{350}DQVHFQPLPPAVV^{362}-conjugates



Response by PBMC from healthy PPD+ subjects stimulated with ^{350}DQVHFQPLPPAVV^{362}-conjugates



Conclusions

1. Conjugation to macromolecules enhances specific T cell response against an epitope from M.tuberculosis protein in PPD+ healthy individuals.

2. Conjugation to macromolecules has no effect on specific T cell response against epitope from M.tuberculosis protein in PPD- healthy individuals.

Summary: Target proteins

Mucin 1, mucin 2
glycoproteins

Tuberculin proteins
HSV gD glycoprotein
