

Structure and Efficacy of Drugs

Studying the effectivity of different compounds during the drug development in the field of oncology

József Tóvári, PhD, head

Department of Experimental Pharmacology
National Institute of Oncology

Tumors

- Originated from all cell types
- Every 3rd – 4th people
- Hungary is „leading” country
- Genetical inheridity
- Enviromental factors (smoking)
- Benign and malignant
- mutations: peptides with malfunctions

Mutations in DNA → malfunct. peptides → Tumor cells

Outside reasons

- **Smoking**
- **Alcohol**
- **Irradiation**
- **Viruses**
- **Chemicals**

Inside reasons

- **Genetical susceptibility/onheretance**
- **Immun system**
- **hormones**

Smoking

- App. 4000 chemicals in the fume
- More than 40 is carcinogen!!
- Lung, esophagus, trachea, head and neck, bladder, gastric tumors...

Lung cancer: rapid progression, resistance to therapy

Risc factors

- **Alcohol:**

Soral, head and neck, oesophagus, gastric, liver, breast

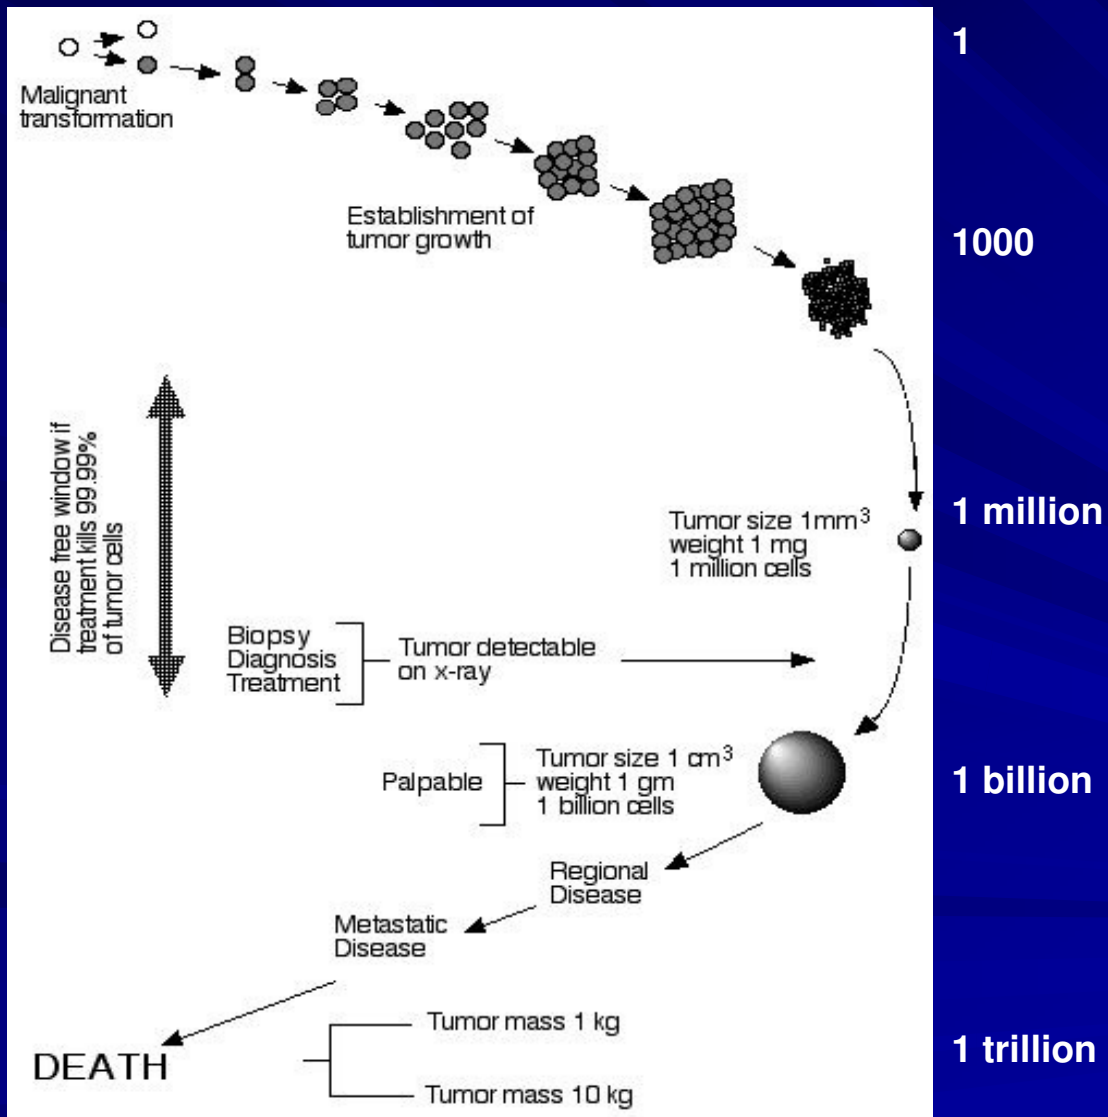

- **Irradiation:** cosmic background, UV, radioactivity

- **Viruses:** HPV (16,18); Hepatitis B, C; HIV, HTLV, Eppstein-Barr. Herpes 8 (?)

- **Worms:** (Schistosoma species), bacteria (Helicobacter pilori: stomach)

- **Chemicals:** tar (benzol derivatives), serpentine, stb...

Tumor cell number – tumor size

Classification of the tumors (samples)

- Benign
- Malignant

- Carcinoma (epithelial)
- Sarcoma (mesenchimal)
- Leukaemia, Lymphoma, Melanoma etc

- Grading: differentiation (1-4, well-moderate-week)
- Staging: **T** (0-4) **N** (0-3) **M** (0-1) chategories

Metastasis

Figure 23–15. Molecular Biology of the Cell, 4th Edition.

Stage III (skin primary)

Stage-III (LND metastasis)

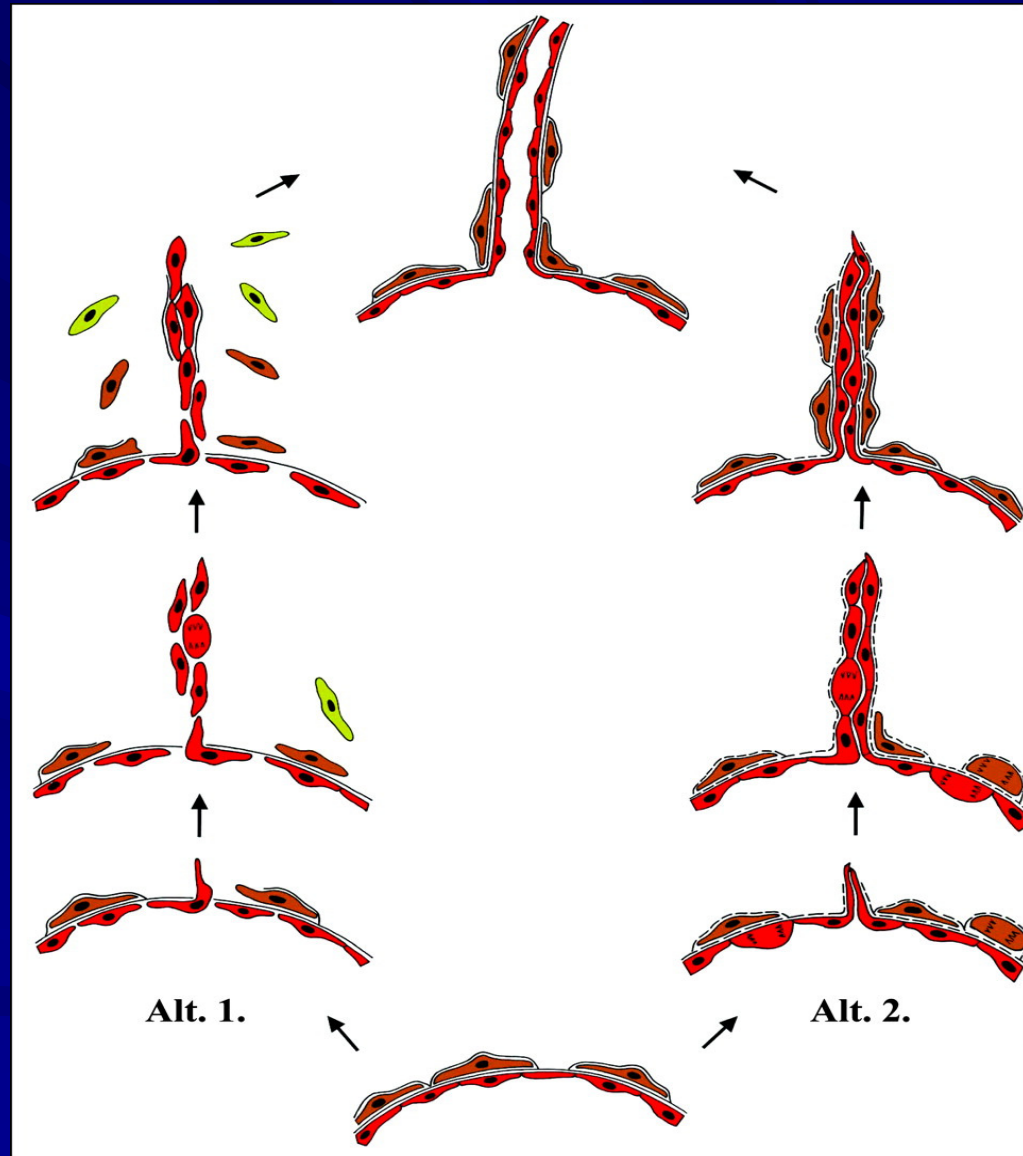

Stage-IV (visceral metastasis)

Steps of the metastatic cascade

- 1./ Tumor growth, local invasion *, angiogenesis *
- 2./ Tumor cell escape from the primer mass *
- 3./ Intravaztion *
- 4./ Tumor cell interaction with cells in blood stream *
- 5./ Arrest in the target organ *
- 6./ Extravazation *

* adhesion - digestion - migration

Tumor-induced neoangiogenesis

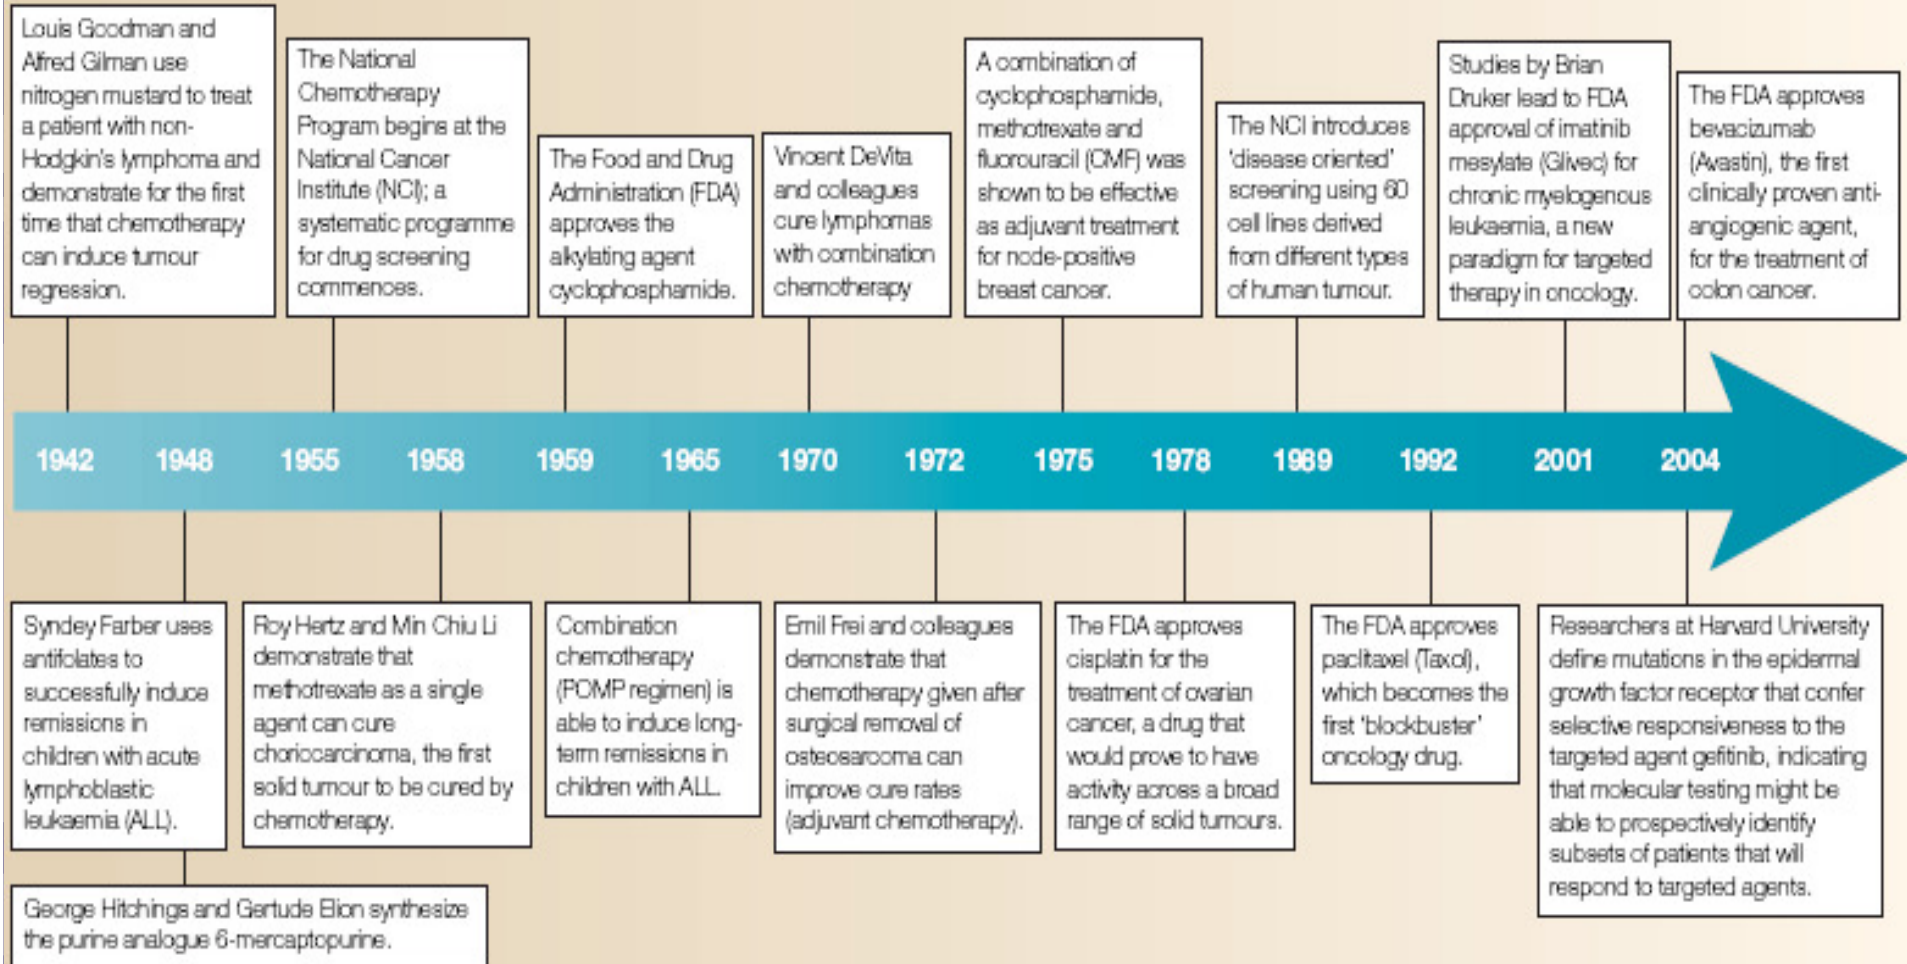

Tumor cell migration

Therapy

- **Surgery** (First line in the case of solid tumors, curative if no metastasis)
- **Radiotherapy** (Ionisation, free radicals, DNA damage)
- **Chemotherapy**
 - Traditional: cell proliferation blockade
 - Innovative: target-specific
personal based

Timeline | The history of chemotherapy

1) Alkylating agent:
DNA crossbinding, transcription ↓

1) Antimetabolites:
S pahase, DNS synthesis ↓

Folate analogues (methotrexate)

pyrimidine analogues:
(fluorouracil)

purine analogues:
(mercaptopurine).

3) Natural compounds:
vinca alkaloides (vincristine),
taxanes (paclitaxel), and
epipodophyllotoxines
(etoposide).

DNA and RNA synthesis ↓
formation of microtubules ↓

Mechanism of Action: Photodynamic Reaction

http://www.orienttumor.com/english/MT/PDT/002_s.jpg

<http://www.gene.com/gene/research/images/angiogenesis.jpg>

- Photodynamic Therapy: photosensitivity
- Hormon treatments: breast, prostate
- Angiogenesis inhibition: bevacizumab, anti-VEGF antibody.

- Tirozin-kinase Inhibitors:
EGFR (gefitinib, erlotinib, Cetuximab) Bcr-Abl (Imatinib)

<http://www.amn107.com/images/aee788Large.jpg>

Strategy in the development

- Early detection
- Diagnosis
- Therapy

Goals:

- Identification of new targets
- New molecules for prediction
- Imaging in early phase of tumor
- Drug delivery
- Monitoring of the therapy
- New methods for improving of quality of life (QOL)

From development to therapy

Different phases of drug development

■ Preclinical phase

in vitro and *in vivo* (animal models) techniques

■ Clinical Phases

Phase I.

Intolerance, insalubrity: healthy volunteer

Phase II.

Doses, side effects: few patients

Phase III.

Best dose and formulation: large number of patients

Registration: EMEA (European Medical Evaluation Agency)

Phase IV.

Collecting the observations from the practice

Difficulties

- ❑ **„Pills”: annual 700 Billion USD
(45% USA, 30% EU)**
- ❑ **10.000 molecules - 1 drug**
- ❑ **12 years from first results to the market**
- ❑ **1 Billion USD total cost**
- ❑ **1/10 blockbuster, 1-2 give profit**

Steps of drug development

- Molecule design/synthesis - (drug „targeting” find the target molecules or biological step)
- *in silico, in vitro/ex vivo* screening (High throughput, HTS):
lead molecule
- Lead optimization: millions of molecules
- Biological screenings
- Animal experiments
- Formulation, synthesis, volume increasion

Pharmacology

- Primer pharmacodynamics: effect on target
- Secunder: effect on off-targets
- Safety pharmacology: to find unwanted effects
- Dose – efficacy scale
- central nervous system, circulation, respiration,secretion

Toxicology

- Dose level enumeration
- LD50: median lethal dose
- Acute, subacute/chronic toxicity
- genotoxicity: mutagenesis (carcinogenicity)
- Immunotoxicity
- local tolerability

3R rules in animal experiments

Replacement, Refinement and Reduction of animals

Alternative techniques (in vitro cell-based, ex vivo)

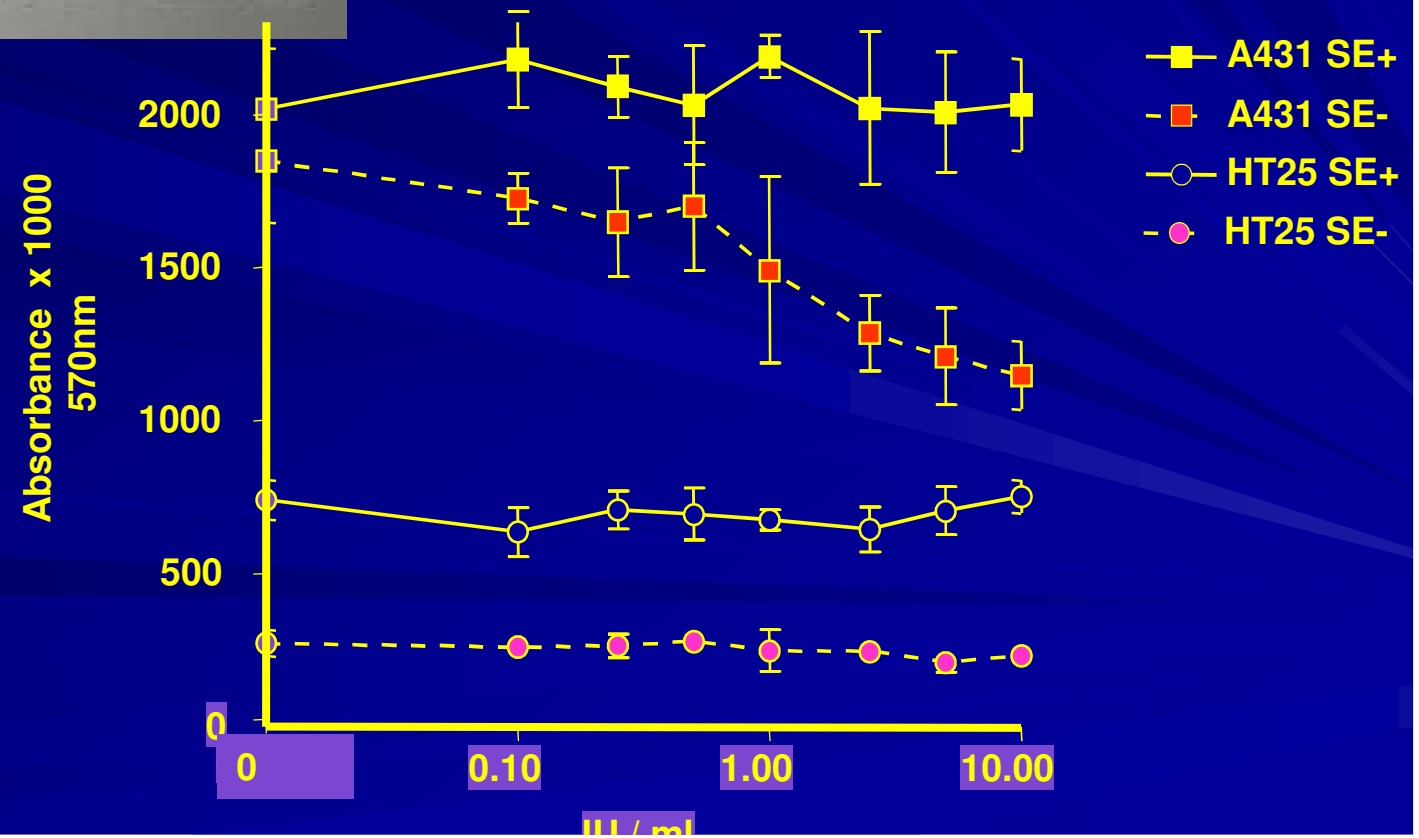

Optimalization of the target/goals, decreased burden

Minimal animal number / groups

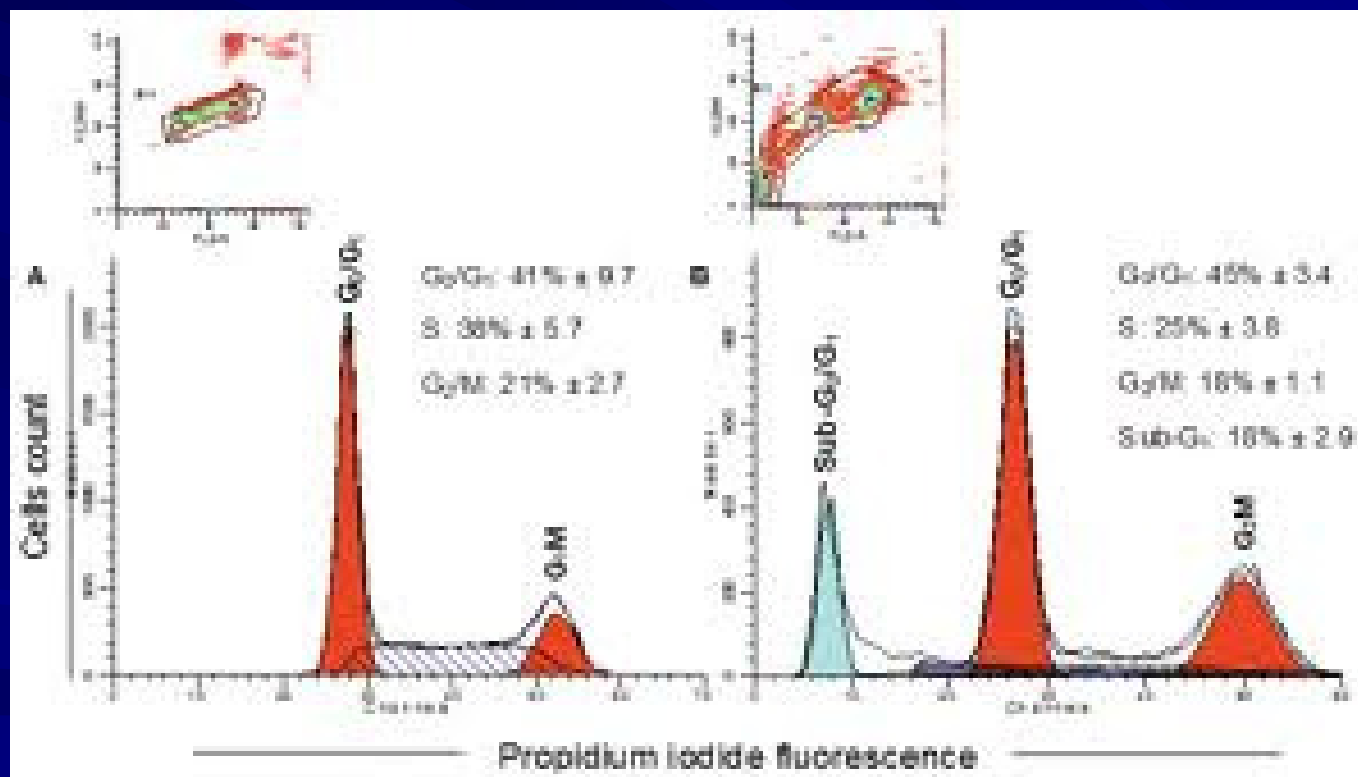

Drugs against tumors

- Cell Proliferation
- Apoptózis (cell death)
- Cell movement / cell adhesion
- Angiogenesis

MTT proliferation assay

Apoptosis (flow cytometry)

Cell migration (Boyden chamber)

Animal models

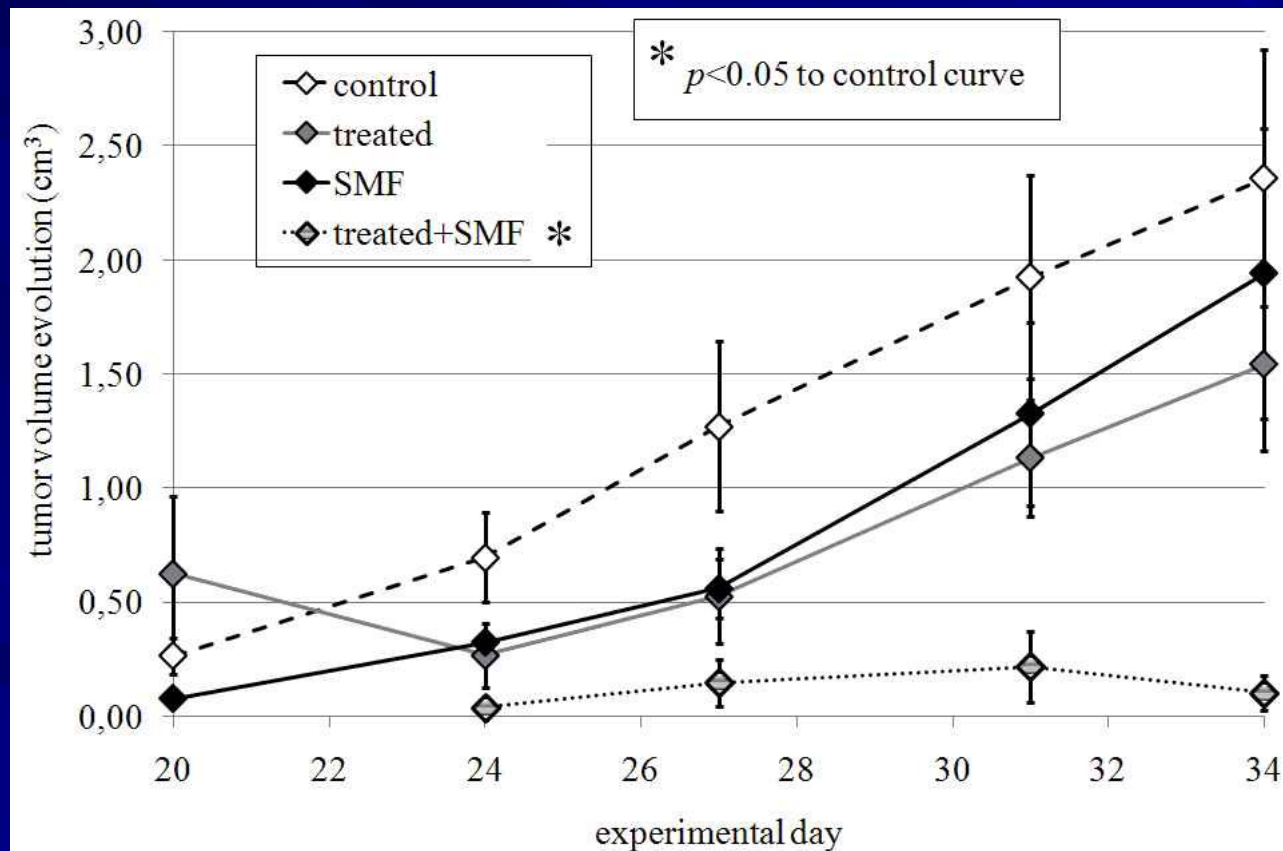

- Allograft (mouse in mice); xenograft (human tumor cells in mice)
- *Subcutan transplantation*: tumor cells / tumor fragments: growth measurement; inhibitors dose-time correlations
- *orthotopic transpl.:* original tissue environment (prostate, breast, colon, lung brain...)
- *metastasis models*: intra cardiac-, intra venous transplantations...

Subcutan inoculation

Tumor volumes

$$\text{Volume} = \text{length} \times \text{width}^2 \times \pi / 6$$

Orthotopic transplantation

Zhao MD et al. Biomaterials 33(2) 2012. 634-43.

Intra cardiac

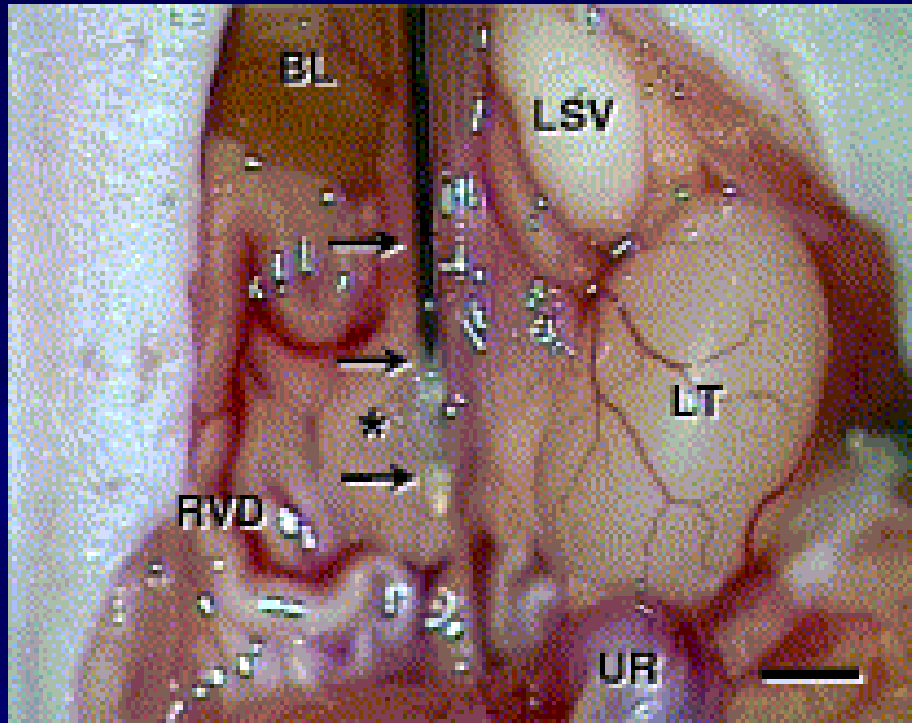

intra bowel

Prostate

Mammary fat pad

Imaging

Intra venous – lung colonies

Control

dp4

dp18

dp22

Tumor cells in the lung tissue

Spleen – liver model

Spleen primer – liver colonies

Hoechst

Control

rHuEPO

Doxorubicin

Tovari et al: Cancer Res 2005.

Immunohistochemistry: hypoxic areas

CD31+ vessels in A431 and HT25 tumor xenograft

Control

rHuEPO

CD31

PI

Effects of rHuEPO on tumor and endothelial cell proliferation *in vivo*

CD31

Nucleus

BrdU

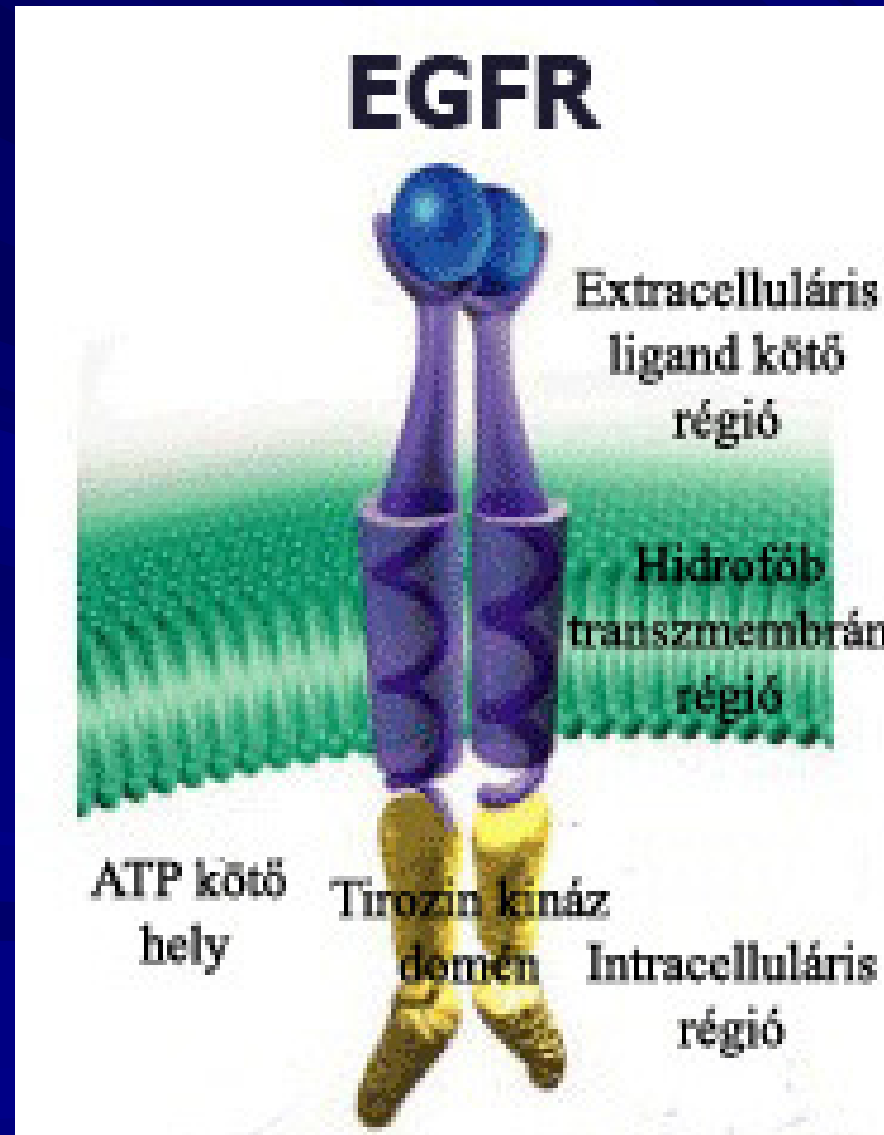

Endotheliális precursor cells in NSCLC (confocal microscopy)

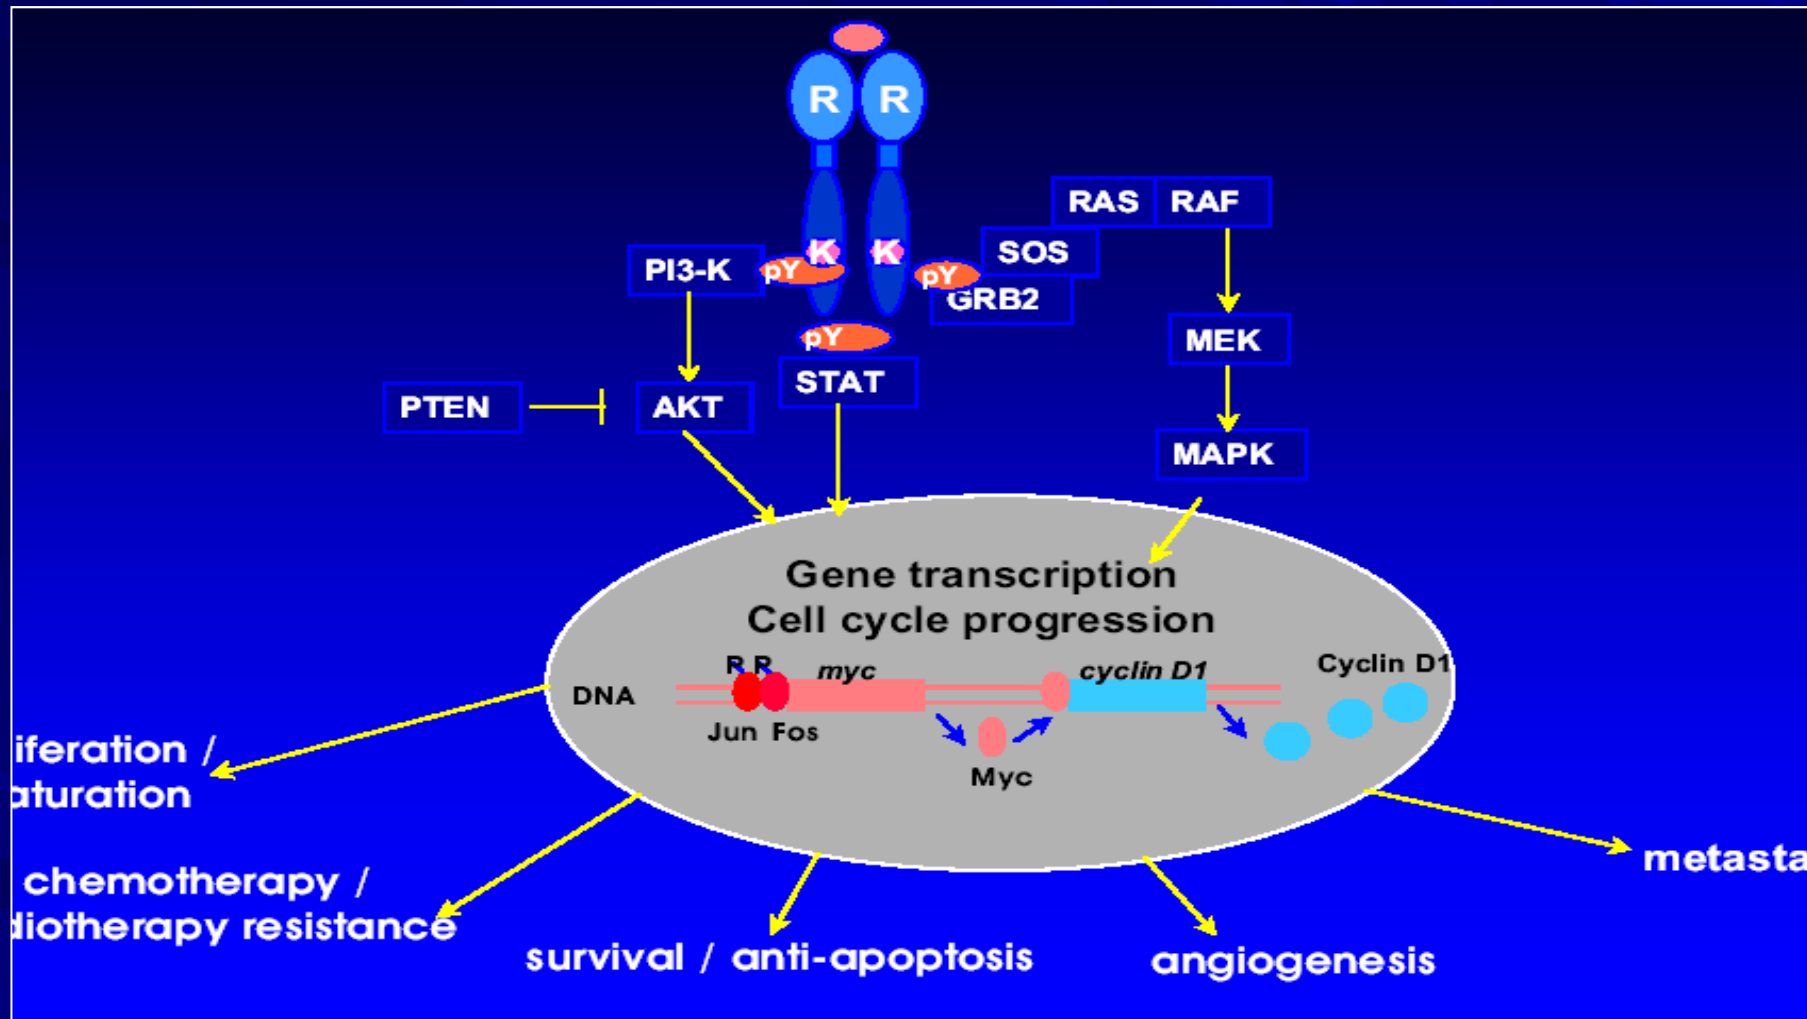

CD133, sejtmag, **CD31**

Target-specific therapy (EGFR)

EGFR signaling

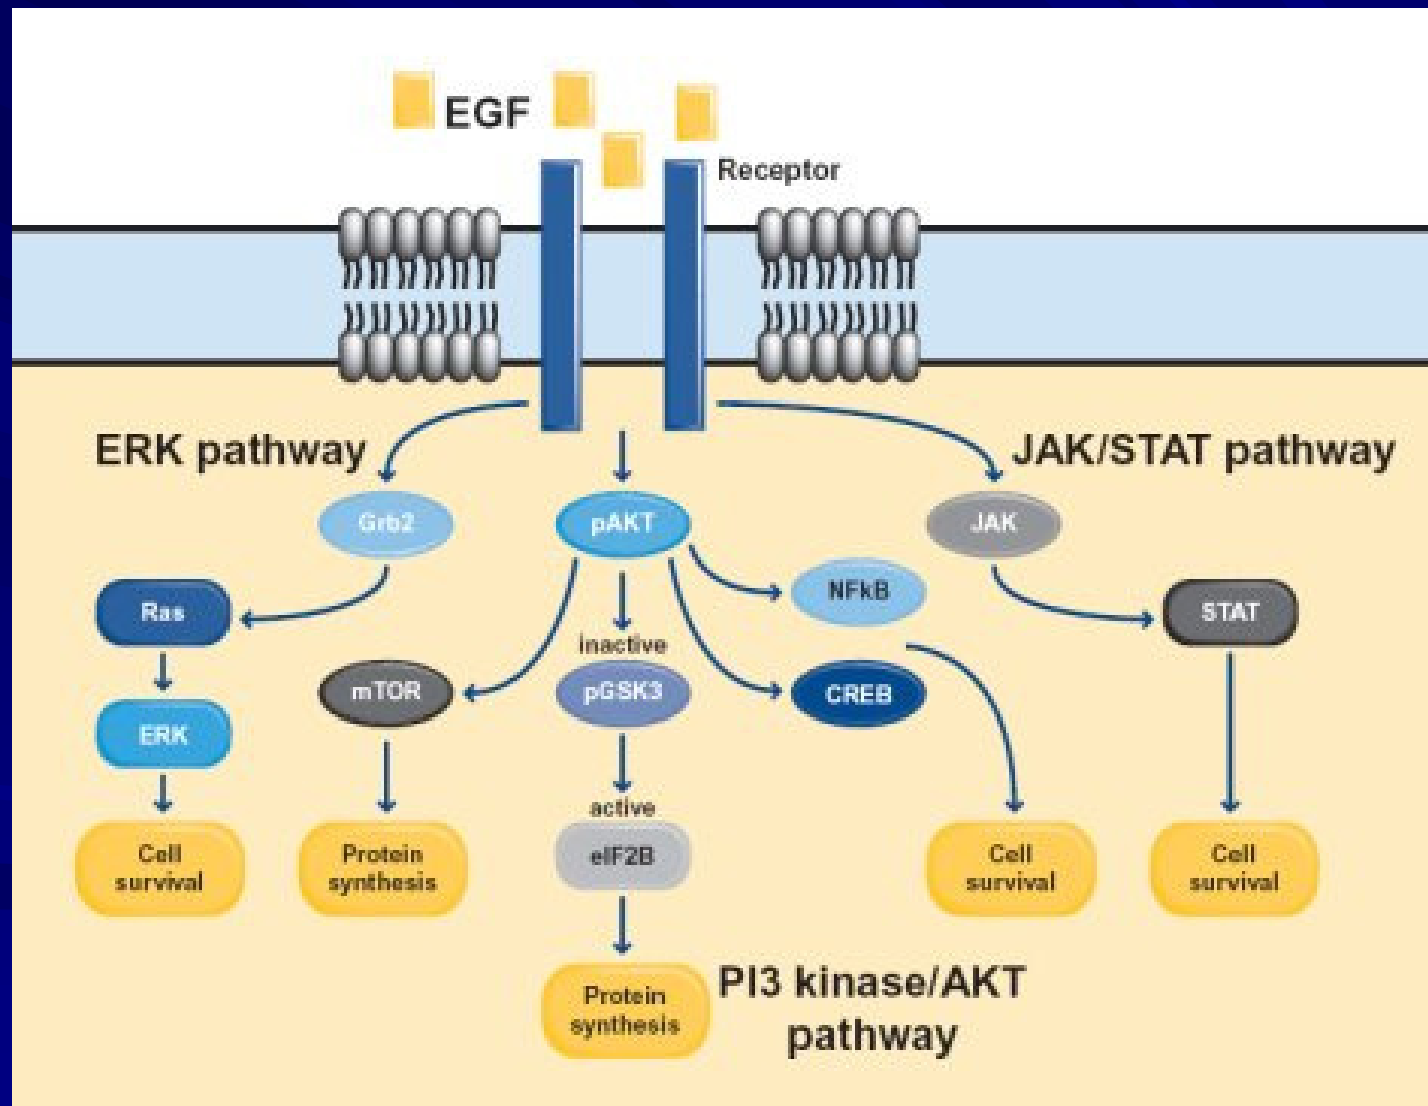

Anti-EGFR therapies

- Monoclonal antibodies:
 - CETUXIMAB (Erbix - *Merck*)
HNSCC combined with radiotherapy
- Tirozin- kinase inhibitors:
 - ERLOTINIB (Tarceva – *Roche*)
NSCLC, pancreatic tumors
 - GEFITINIB (Iressa – *Astra Zeneca*):

Alterations of EGFR in tumors

- Overexpression
- Gene amplification
(~ 13% *Freier és mtsai, Cancer Res. 2006*)
- TK domain mutations: exon 19, 21
- Extracellular deletion– vIII variant
(~ 42% - *Sok JC és mtsai, Clin. Cancer Res. 2006*)
- + RAS mutations → anti-EGFR therapy ineffective

Role of RAS in EGFR signaling

Development of Anti-EGFR small TK-inhibitors

Isolated enzyme (TK activity IC50): 33nM

Cell culture (proliferation inhibit. IC50): 1-2uM

In vivo usage: 2 mg/kg

Challenges in the drug development

- Protection against biological degradation
- Delivery
- Side effects
- Cost benefit analysis

Drug administrations

- Oral Delivery
- Inhalation
- Transdermal
- Implantation
- Injection

Nanotechnology in Oncology

Early detection

Imaging

Therapy

Early Cancer Detection

➤ AFM microscopy

➤ Nanowires

Conduction

cc: 10×10^{-15}

Molecular Cancer Imaging (QDs)

➤ Tumor Targeting and Imaging

Size: (2 nm-7 nm)

Color is size dependent

➤ X-ray + Optical Imaging

Small tumors

Lokalization

0 hour

3 hour

6 hour

Nanoparticles for drug delivery

- Metal-based nanoparticles
- Lipid-based nanoparticles
- Polymer-based nanoparticles
- Biological nanoparticles

Micelles

Vesicles

**Multifunctional
Dendritic Polymers**

Pharmaceutical carriers

Liquid Crystals

Nanocapsules

Nanospheres

Liposomes

Liposome for Drug Delivery

„Nanopowders”

Carbon 60

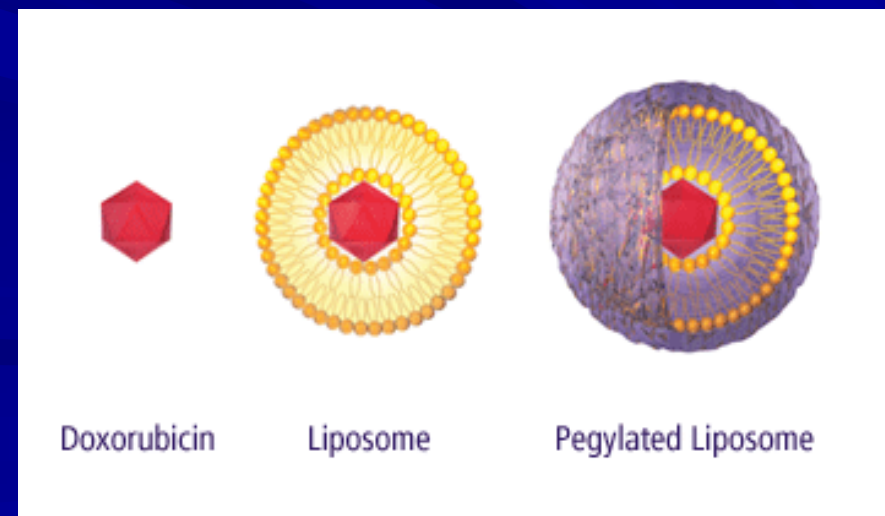

■ Two FDA approved nano drugs:

1. Abraxane[®]: albumin-bound paclitaxel (130 nm). FDA: 2005 January.

2. Doxil[®]: Liposome covered doxorubicin (100 nm).
FDA: 2005 February.
